REPORTING OF ERRORS

You can improve this manual by recommending improvements using DA Form 2028-2 located in the back of the manual. Simply fear out the self-addressed form, fill it out as shown on the sample, fold it where shown, and drop it in the mail.
If there are no blank DA Forms 2028-2 in the back of your manual, use the standard DA Form 2028 (Recommended Changes to Publications and Blank Forms) and forward to Commander, US Army Communications and Electronics Materiel Readiness Command, ATTN: DRSEL-ME-MQ, Fort Monmouth, NJ 07703.
In either case a reply will be forwarded direct to you.

SERIAL NUMBERS

This manual applies directly to instruments with serial numbers prefixed 1704.

This manual is an authentication of the manufacturer's commercial literature which, through usage, has been found to cover the date required to operate and maintain this equipment. Since the manual was not prepared in accordance with military specifications and AR 310-3, the format has not been structured to consider levels of maintenance.

SAFETY PRECAUTIONS

A periodic review of safety precautions in TB 385-4 is recommended. When the equipment is operated with covers removed while performing maintenance, DO NOT TOUCH exposed connections or components. MAKE CERTAIN you are not grounded when making connections or adjusting components inside the power supply.

WARNING

HIGH VOLTAGE is used during the performance of maintenance as instructed in this manual. DEATH ON CONTACT may result if personnel fail to observe safety precautions.

WARNING

DO NOT ATTEMPT to make internal connections or adjustments unless another person, capable of performing first aid, is present.

WARNING

For electric shock protection, use only extension cords and power receptacles with a safety-ground connector, or otherwise connect the chassis to a safety ground system.

CERTIFICATION

Hewlett-Packard Company certifies that this instrument met its published specifications at the time of shipment from the factory. Hewlett-Packard Company further certifies that its calibration measurements are traceable to the United States National Bureau of Standards, to the extent allowed by the Bureau's calibration facility, and to the calibration facilities of other International Standards Organization members.

WARRANTY AND ASSISTANCE

This Hewlett-Packard product is warranted against defects in materials and workmanship for a period of one year from the date of shipment. Hewlett-Packard will, at its option, repair or replace products which prove to be defective during the warranty period provided they are returned to Hewlett-Packard, and provided the preventive maintenance procedures in this manual are followed. Repairs necessitated by misuse of the product are not covered by this warranty. NO OTHER WARRANTIES ARE EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. HEWLETT PACKARD IS NOT LIABLE FOR CONSEQUENTIAL DAMAGES.

Service contracts or customer assistance agreements are available for Hewlett-Packard products.

For any assistance, contact your nearest Hewlett-Packard Sales and Service Office. Addresses are provided at the back of this manual.

SAFETY CONSIDERATIONS

GENERAL

This is a Safety Class I instrument. This instrument has been designed and tested according to IEC Publication 348, "Safety Requirements for Electronic Measuring Apparatus."

OPERATION

BEFORE APPLYING POWER verify that the power transformer primary is matched to the available line voltage and the correct fuse is installed (see Section II). Make sure that only fuses with the required rated current and of the specified type (normal blow, time delay, etc.) are used for replacement. The use of repaired fuses and the short-circuiting of fuseholders must be avoided.

SERVICE

Although this instrument has been designed in accordance with international safety standards, this manual contains information, cautions, and warnings which must be followed to ensure safe operation and to retain the instrument in safe condition. Service and adjustments should be performed only by qualified service personnel. Any adjustment, maintenance, and repair of the opened instrument under voltage should be avoided as much as possible and, when inevitable, should be carried out only by a skilled person who is aware of the hazard involved.

Capacitors inside the instrument may still be charged even if the instrument has been disconnected from its source of supply.

Whenever it is likely that the protection has been impaired, the instrument must be made inoperative and be secured against any unintended operation.

WARNING

IF THIS INSTRUMENT IS TO BE ENERGIZED VIA AN AUTOTRANSFORMER (FOR VOLTAGE REDUCTION) MAKE SURE THE COMMON TERMINAL IS CONNECTED TO THE EARTHED POLE OF THE POWER SOURCE.

WARNING

BEFORE SWITCHING ON THE INSTRUMENT, THE PROTECTIVE EARTH TERMINALS OF THE INSTRUMENT MUST BE CONNECTED TO THE PROTECTIVE CONDUCTOR OF THE (MAINS) POWER CORD. THE MAINS PLUG SHALL ONLY BE INSERTED IN A SOCKET OUTLET PROVIDED WITH A PROTECTIVE EARTH CONTACT. THE PROTECTIVE ACTION MUST NOT BE NEGATED BY THE USE OF AN EXTENSION CORD (POWER CABLE) WITHOUT A PROTECTIVE CONDUCTOR (GROUNDING).

WARNING

THE SERVICE INFORMATION FOUND IN THIS MANUAL IS OFTEN USED WITH POWER SUPPLIED AND PROTECTIVE COVERS REMOVED FROM THE INSTRUMENT. ENERGY AVAILABLE AT MANY POINTS MAY, IF CONTACTED, RESULT IN PERSONAL INJURY.

CAUTION

BEFORE SWITCHING ON THIS INSTRUMENT:

1. **MAKE SURE THE INSTRUMENT IS SET TO THE VOLTAGE OF THE POWER SOURCE.**
2. **ENSURE THAT ALL DEVICES CONNECTED TO THIS INSTRUMENT ARE CONNECTED TO THE PROTECTIVE (EARTH) GROUND.**
3. **ENSURE THAT THE LINE POWER (MAINS) PLUG IS CONNECTED TO A THREE-CONDUCTOR LINE POWER OUTLET THAT HAS A PROTECTIVE (EARTH) GROUND. (GROUNDING ONE CONDUCTOR OF A TWO-CONDUCTOR OUTLET IS NOT SUFFICIENT.)**
4. **MAKE SURE THAT ONLY FUSES WITH THE REQUIRED RATED CURRENT AND OF THE SPECIFIED TYPE (NORMAL BLOW, TIME DELAY, ETC.) ARE USED FOR REPLACEMENT. THE USE OF REPAIRED FUSES AND THE SHORT-CIRCUITING OF FUSE HOLDERS MUST BE AVOIDED.**

SECTION 0
INTRODUCTION

0-1. SCOPE

a. This manual describes Signature Analyzer TS-3791/U (fig. 1-1) and provides maintenance instructions. Throughout this manual, TS-3791/U is referred to as the Hewlett Packard (HP) Model 5004A Signature Analyzer.

0-2. INDEXES OF PUBLICATIONS.

a. DA Pam 3104. Refer to the latest issue of DA Pam 310-4 to determine whether there are new editions, changes, or additional publications pertaining to the equipment.

b. DA Pam 310-7. Refer to DA Pam 310-7 to determine whether there are modification work orders (MWO's) pertaining to the equipment.

0-3. FORMS AND RECORDS.

a. Reports of Maintenance and Unsatisfactory Equipment. Maintenance forms, records, and reports which are to be used by maintenance personnel at all maintenance levels are listed in and prescribed by TM 38-750.

b. Report of Packaging and Handling Deficiencies. Fill out and forward DD Form 6 (Packaging Improvement Report) as prescribed in AR 70058/NAVSUPINST 4030.29/AFR 71-13/MCO P4030.29A and DLAR 4145.8.

c. Discrepancy in Shipment Report (DISREP) (SF 361). Fill out and forward Discrepancy in Shipment Report (DISREP) (SF 361) as prescribed in AR 55-38/NAVSUPINST 4610.33B/AFR 7518/MCO P4610.19C and DLAR 4500.15.

0-4. REPORTING EQUIPMENT IMPROVEMENT RECOMMENDATIONS (EIR).

EIR's will be prepared using SF 368 (Quality Deficiency Report). Instructions for preparing EIR's are provided in TM 38-750, the Army Maintenance Management System. EIR's should be mailed direct to Commander, US Army Communication and Electronics Materiel Readiness Command, ATTN: DRSEL-ME-MQ, Fort Monmouth, NJ 07703. A reply will be furnished direct to you.

0-5. ADMINISTRATIVE STORAGE.

Administrative storage of equipment issued to and used by Army activities shall be in accordance with TM 740-90-1 and paragraph 2-8.

0-6. DESTRUCTION OF ARMY ELECTRONICS MATERIEL.

Destruction of Army electronics materiel to prevent enemy use shall be in accordance with TM 750-244-2.

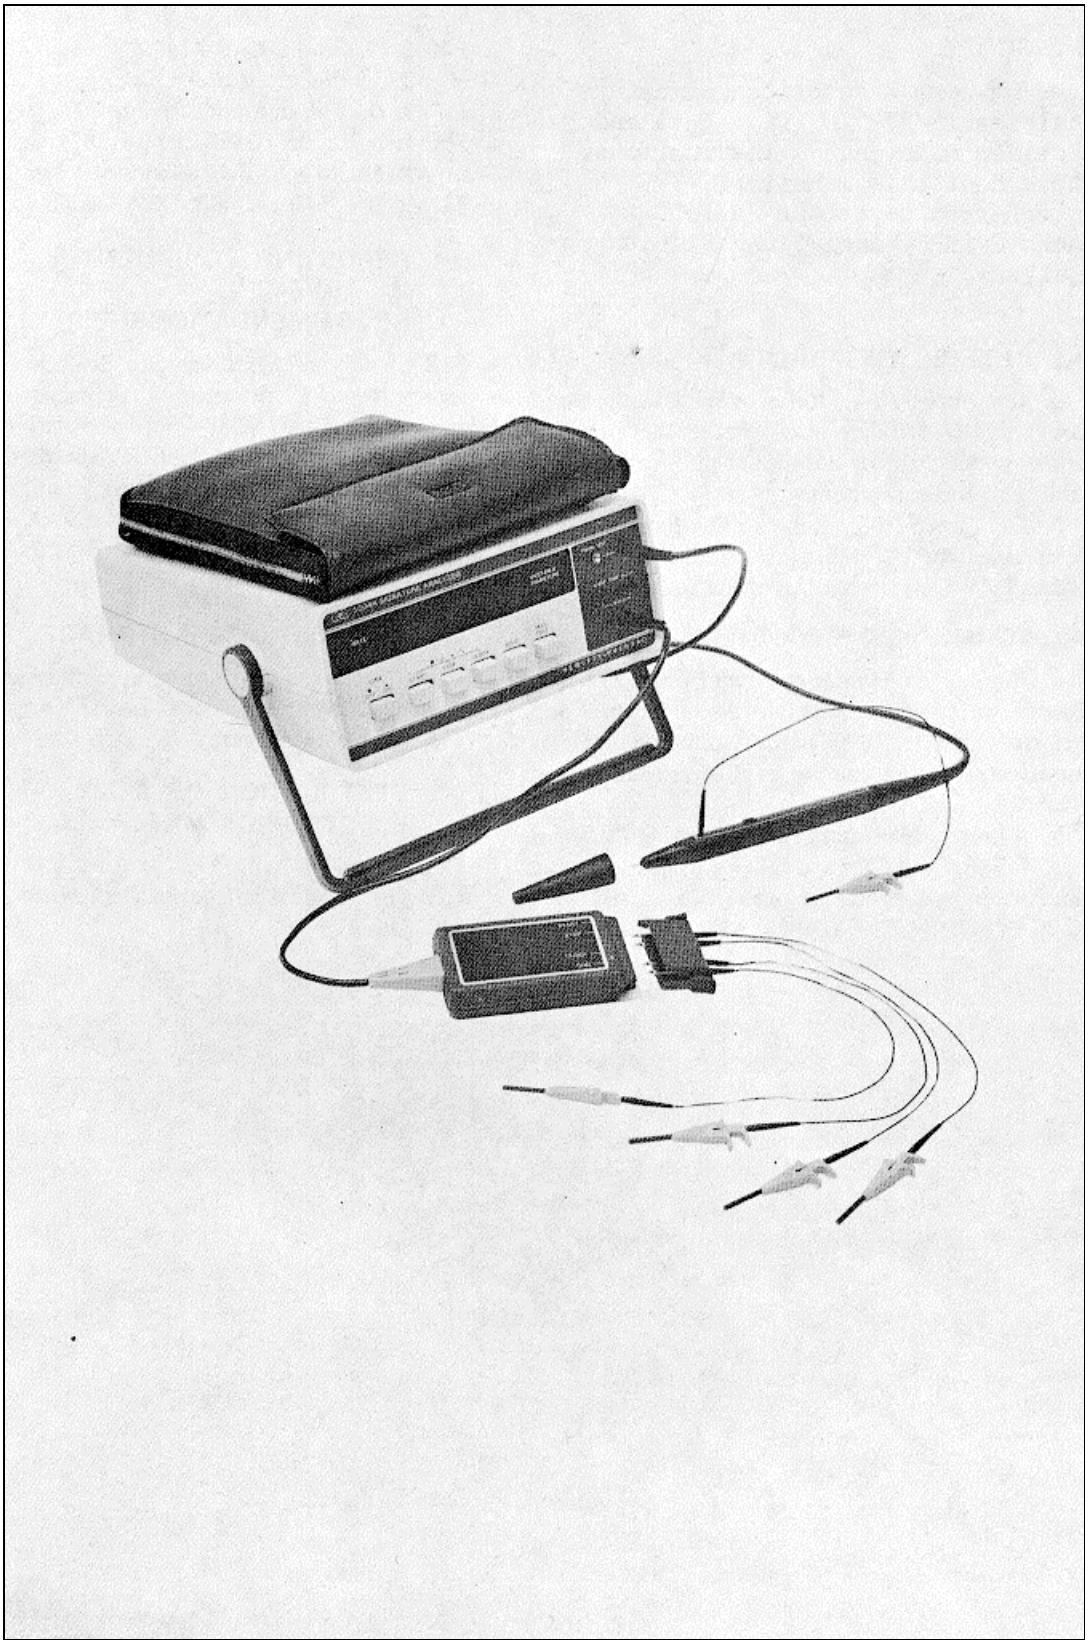

Figure 1-1. Model 5004A Signature Analyzer

SECTION I
GENERAL INFORMATION

1-1. INTRODUCTION

1-2. This operating and service manual contains information needed to operate, test, and service the Hewlett-Packard Model 5004A Signature Analyzer. Figure 1-1 shows the 5004A.

1-3. SAFETY CONSIDERATIONS

1-4. The 5004A Signature Analyzer is a Safety Class I instrument. This instrument has been designed according to international safety standards.

1-5. This operating and service manual contains information, cautions, and warnings which must be followed by the user to ensure safe operation and keep the instrument in safe condition.

1-6. OPTIONS (LINE VOLTAGES)

1-7. Options for the 5004A are the four possible line voltage settings for the instrument. (Any 5004A may be set for any of the four line voltages, but the cabinet must be opened to change the line voltage setting.) The four option numbers are the same as the corresponding line voltages: 100, 120, 220, and 240, (e.g., Option 120 is for 120 Volt line supply). The procedure to change the line voltage setting is given in Section V.

1-8. INSTRUMENTS COVERED BY MANUAL

1-9. Attached to the instrument is a serial number plate. The serial number is in the form: 0000A00000. It is in two parts; the first four digits and the letter are the serial prefix and the last five digits are the suffix. The prefix is the same for all identical instruments; it changes only when a change is made to the instrument. The suffix however, is assigned sequentially and is different for each instrument. The contents of this manual apply to instruments with the serial number prefix(es) listed under SERIAL NUMBERS on the title page.

1-10. An instrument manufactured after the printing of this manual may have a serial number prefix that is not listed on the title page. This unlisted serial number prefix indicates the instrument is different from those described in this manual. The manual for this newer instrument is accompanied by a yellow Manual Changes supplement. This supplement contains "change information" that explains how to adapt the manual to the newer instrument.

1-11. In addition to change information, the supplement may contain information for correcting errors in the manual. To keep this manual as current and accurate as possible, Hewlett-Packard recommends that you periodically request the latest Manual Changes supplement. The supplement for this manual is identified with the manual print date and part number, both of which appear on the manual title page. Complimentary copies of the supplement are available from Hewlett-Packard.

1-12. For information concerning a serial number prefix that is not listed on the title page or in the Manual Changes supplement, contact your nearest Hewlett-Packard office.

1-13. SPECIFICATIONS

1-14. Overall specifications for the 5004A are given in Table 1-1.

Table 1-1. Specifications

DISPLAY:
Signature: Four-digit hexadecimal. Characters 0,1,2,3,4,5,6,7,8,9,A,C,F,H,P,U.
GATE, UNSTABLE SIGNATURE indicators: Panel Lights. Stretching: 100 milliseconds.
Probe-tip indicator: Light indicates high, low, bad-level, and pulsing states.
Minimum pulse width: 10 nanoseconds. Stretching: 50 milliseconds.
PROBABILITY OF CLASSIFYING CORRECT DATA STREAM AS CORRECT: 100%.
PROBABILITY OF CLASSIFYING FAULTY DATA STREAM AS FAULTY: 99.998%.
MINIMUM GATE LENGTH: One clock cycle.
MINIMUM TIMING BETWEEN GATES (from last STOP to next START): One clock cycle.
DATA PROBE:
Input Impedance: 50 KΩ to 1.4 Volt, nominal. Shunted by 7 pF, nominal.
Threshold: Logic one: 2.0 Volt +.2 -.3. Logic zero: .8 Volt, +.3 -.2.
Setup Time: 15 nanoseconds, with .2 volt over-drive. (Data required to be valid at least 15 nanoseconds before selected clock edge.)
Hold Time: 0 nanoseconds. (Data required to be held until occurrence of selected clock edge.)
GATING INPUT LINES:
START, STOP, CLOCK inputs: Input Impedance: 50 Ω to 1.4 volt, nominal. Shunted by 7 pF, nominal. Threshold: 1.4 volt ±.6 (.1 volt hysteresis, typical).
START, STOP inputs:
Setup Time: 25 nanoseconds. (START, STOP to be valid at least 25 nanoseconds before selected clock edge.)
Hold Time: Zero nanoseconds (START, STOP to be held until occurrence of selected clock edge).
CLOCK INPUT:
Maximum clock frequency: 10 MHz.
Minimum Clock Time in High or Low State: 50 nanoseconds.
VOLTAGE OVERLOAD PROTECTION: All inputs ± 150 volts continuous.
± 250 volts intermittent.
250 volts ac for 1 minute.
OPERATING ENVIRONMENT:
Temperature: 0-55°C.
Relative Humidity: 95% at 40°C.
Altitude: 4,600M.
POWER REQUIREMENTS:
Option 100: 100V ac line, +5%, -10%, 48-440 Hz
Option 120: 120V ac line, +5%, -10%, 48-440 Hz
Option 220: 220V ac line, +5%, -10%, 48-66 Hz
Option 240: 240V ac line, +5%, -10%, 48-66 Hz
WEIGHT: Net: 2.5 kg, 5.5 lbs. Shipping: 7.7 kg, 17 lbs.
DIMENSIONS:
90 mm high x 215 mm wide x 300 mm deep (31/2 in. x 51/2 in. x 12 in.)
Dimensions exclude tilt bale, probes, and pouch.

1-15. DESCRIPTION OF 5004A SIGNATURE ANALYZER

1-16. The HP Model 5004A Signature Analyzer is a test instrument for troubleshooting complex electronic logic circuits. It uses the signature analysis technique of troubleshooting.

1-17. Signature Analysis

1-18. Signature analysis is a method of troubleshooting complex electronic logic circuits to the individual component level. To use signature analysis with the 5004A, the unit to be tested must have certain characteristics included with the original design.

Typically a logic product intended for signature analysis troubleshooting will have a programmed controller and a stored short test program that can exercise most of the unit. Usually the test program is started by a "self-test" mode of the instrument. With the test program running, the 5004A (connected to the unit being tested) will display a unique hexadecimal signature for each signature analysis test point in the unit being tested. The 5004A requires four signals from the unit being tested: Clock, Start, Data, and Stop. The CLOCK signal synchronizes the two instruments. The exactly repetitive START and STOP signals define a window during which the DATA signal is being received by the 5004A. After the STOP signal the 5004A displays the unique hexadecimal signature of the data received.

1-19. ACCESSORIES SUPPLIED

1-20. The accessories supplied with the 5004A are shown in Figure 1-1.

a. Depending on the customer's location, the line power cable may be supplied with one of four line (mains) connectors. Refer to the "Power Cable" paragraph in Section II.
b. Five detachable "grabber" test connectors are supplied with the 5004A. Refer to Section III for a description and use.
c. One ground wire for the data probe is supplied with the 5004A.

1-21. RECOMMENDED TEST EQUIPMENT

1-22. Table 1-2 lists recommended test equipment to test, maintain, and troubleshoot the5004A.

Table 1-2. Recommended Test Equipment

INSTRUMENT	CRITICAL SPECS	RECOMMENDED HP MODEL
Pulse Generator	5 ns-100 ns delay	8007B
Pulse Generator	10 MHz, 5 volts pulse	8013B
Oscilloscope with dual-trace vertical amp.	100 MHz	18X, 1805A/1825A
Power Supply	5 volts	6111A
Digital Voltmeter	10 volts	3476A
Resistor	1000Ω 5% 1/4W	0683-1025
Resistor	50Ω 5% 2W	0698-3311
Capacitor	0.1 μF +20% 25V	0170-0022
Capacitor	10 μF +75 -10% 25V	0180-0059
Logic Probe	TTL compatibility	545A
Logic Pulser	TTL compatibility	546A
Logic Current Tracer	1 ma-1 A Range	547A

SECTION II
INSTALLATION

2-1. INTRODUCTION

2-2. This section provides information for inspection, installation, and preparation for use of the 5004A Signature Analyzer.

2-3. INITIAL INSPECTION

2-4. Inspect the shipping container for damage. If the shipping container or cushioning material is damaged, it should be kept until the contents of the shipment have been checked for completeness and the instrument has been checked mechanically and electrically. The contents of the shipment should be as shown in Figure 1-1; procedures for checking electrical performance are given in Section IV. If the contents are incomplete, if there is mechanical damage or defect, or if the 5004A does not pass the performance tests, notify the nearest Hewlett-Packard office. If the shipping container is damaged, or the cushioning material shows signs of stress, notify the carrier as well as the Hewlett-Packard office. Keep the shipping materials for carrier's inspection. The HP office will arrange for repair or replacement at HP option without waiting for claim settlement.

2-5. PREPARATION FOR USE

2-6. Power Requirements

2-7. The 5004A requires a power source as shown in Section I, Specifications.

2-8. Line Voltage Selection

2-9. Changing the 5004A power source voltage setting requires the 5004A cabinet to be opened. Instructions for changing the line voltage setting are given in Section V.

2-10. Line Voltage Label

2-11. The original line voltage setting for each 5004A as manufactured is printed on a label on the back panel of each 5004A. Check this label and compare the voltage (100, 120, 220, or 240) with your local line voltage supply. If you do not have the correct line voltage for your 5004A, notify a qualified technician and refer to Section V of this manual.

2-12. Power Cable

2-13. The 5004A is shipped with a three-wire power cable. When the cable is connected to an appropriate ac power source, this cable grounds internal "grounds" in the 5004A and the two exposed screws on the rear panel heat sink. The type of power cable plug shipped with each instrument depends on the country of destination. Refer to Figure 2-1 for the part numbers of the power cable and plug configurations available.

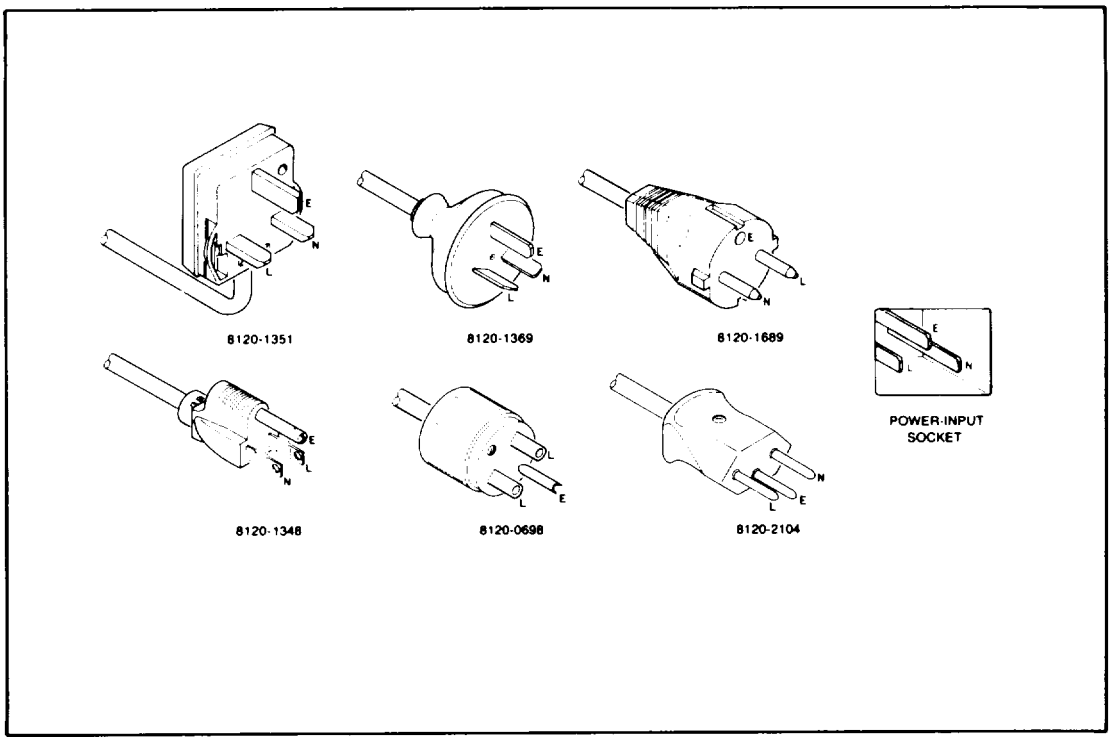

Figure 2-1. Power Cable HP Part Numbers Versus Mains Plugs Available

WARNING

BEFORE SWITCHING ON THIS INSTRUMENT, THE PROTECTIVE EARTH TERMINALS OF THIS INSTRUMENT MUST BE CONNECTED TO THE PROTECTIVE CONDUCTOR OF THE (MAINS) POWER CORD. THE MAINS PLUG SHALL ONLY BE INSERTED IN A SOCKET OUTLET PROVIDED WITH A PROTECTIVE EARTH CONTACT. THE PROTECTIVE ACTION MUST NOT BE NEGATED BY THE USE OF AN EXTENSION CORD (POWER CABLE) WITHOUT A PROTECTIVE CONDUCTOR (GROUNDING).

2-14. Operating Environment

2-15. TEMPERATURE. The 5004A may be operated in temperatures from 0°C to +550C.

2-16. HUMIDITY. The 5004A may be operated in environments with humidity up to 95%. However, it should be protected from temperature extremes which cause condensation in the instrument.

2-17. ALTITUDE. The 5004A may be operated at altitudes up to 4,600 meters.

2-18. STORAGE AND SHIPMENT

2-19. Environment

2-20. The instrument may be stored or shipped in environments within the following limits:

Temperature	-40°C to +75°C
Humidity	Up to 95%
Altitude	4,600 meters (15,000 feet)

2-21. The instrument should also be protected from temperature extremes which cause condensation within the instrument.

2-22. Packaging

2-23. ORIGINAL PACKAGING. Containers and materials identical to those used in factory packaging are available through Hewlett-Packard offices. If the instrument is being returned to Hewlett-Packard for servicing, attach a tag indicating the type of service required, return address, model number, and full serial number. Also, mark the container FRAGILE to ensure careful handling. In any correspondence, refer to the instrument by model number and full serial number.

2-24. OTHER PACKAGING. The following general instructions should be used for repacking with commercially available materials:

a. Wrap instrument in heavy paper or plastic. (If shipping to Hewlett-Packard office or service center, attach tag indicating type of service required, return address, model number, and full serial number.)
b. Use strong shipping container. A double-wall carton made of 350-pound test material is adequate.
c. Use a layer of shock-absorbing material 70 to 100 mm (3- to 4-inch) thick around all sides of the instrument to provide firm cushioning and prevent movement inside container. Protect control panel with cardboard.
d. Seal shipping container securely.
e. Mark shipping container FRAGILE to ensure careful handling.
f. In any correspondence, refer to instrument by model number and full serial number.

SECTION III
OPERATION

3-1. INTRODUCTION

3-2. This section explains the functions of the operating controls, indicators, probe, and test connectors of the 5004A Signature Analyzer. An operator's self-test is given, and the normal operating modes are described.

3-3. PANEL FEATURES

3-4. Front panel features of the Signature Analyzer are described in Figure 3-1. This figure contains a detailed description of the controls, connectors, and indicators.

3-5. SIGNATURE DISPLAY

3-6. The 5004A Signature Analyzer presents digital signatures with a four-character (symbol) display on its front panel. Each character, which can be any one of 16 symbols, is shown on a 7-segment light-emitting-diode display 10 by 7 millimeters. The 16 possible characters are:

3-7. The characters presented on the display are a hexadecimal number which is the residue of a count in the 5004A after a START and a STOP signal have been received with some data bits in between.

NOTE

No signature appearing on the 5004A display has any particular significance beyond being a correct (expected) signature or an incorrect signature. The number is, however, a count residue in the 5004A converted to and displayed in hexadecimal.

3-8. HEXADECIMAL NUMBER SYSTEM SYMBOLS (DIGITS)

3-9. The four-digit front panel display presents numbers in a special set of hexadecimal symbols (see preceding paragraph). Note that the final six symbols are not the common hexadecimal symbols ABCDEF because the seven-segment display of the 5004A can not show a B or D that would be different from an 8 or 0 respectively (and several other symbols could be ambiguous).

3-10. TEST TERMINAL GRABBER CONNECTORS

3-11. Five test-terminal grabber-connectors are supplied with the 5004A. The grabbers are push-on pull-off connectors. A grabber can be used on the end of the active test pod test leads to make reliable electrical connections from the 5004A to the instrument being tested. Figure 3-1 shows grabbers connected to the pod test leads. Figure 3-4 shows grabbers connected to a device being tested. The removeable ground (common) test lead for the probe also has a grabber.

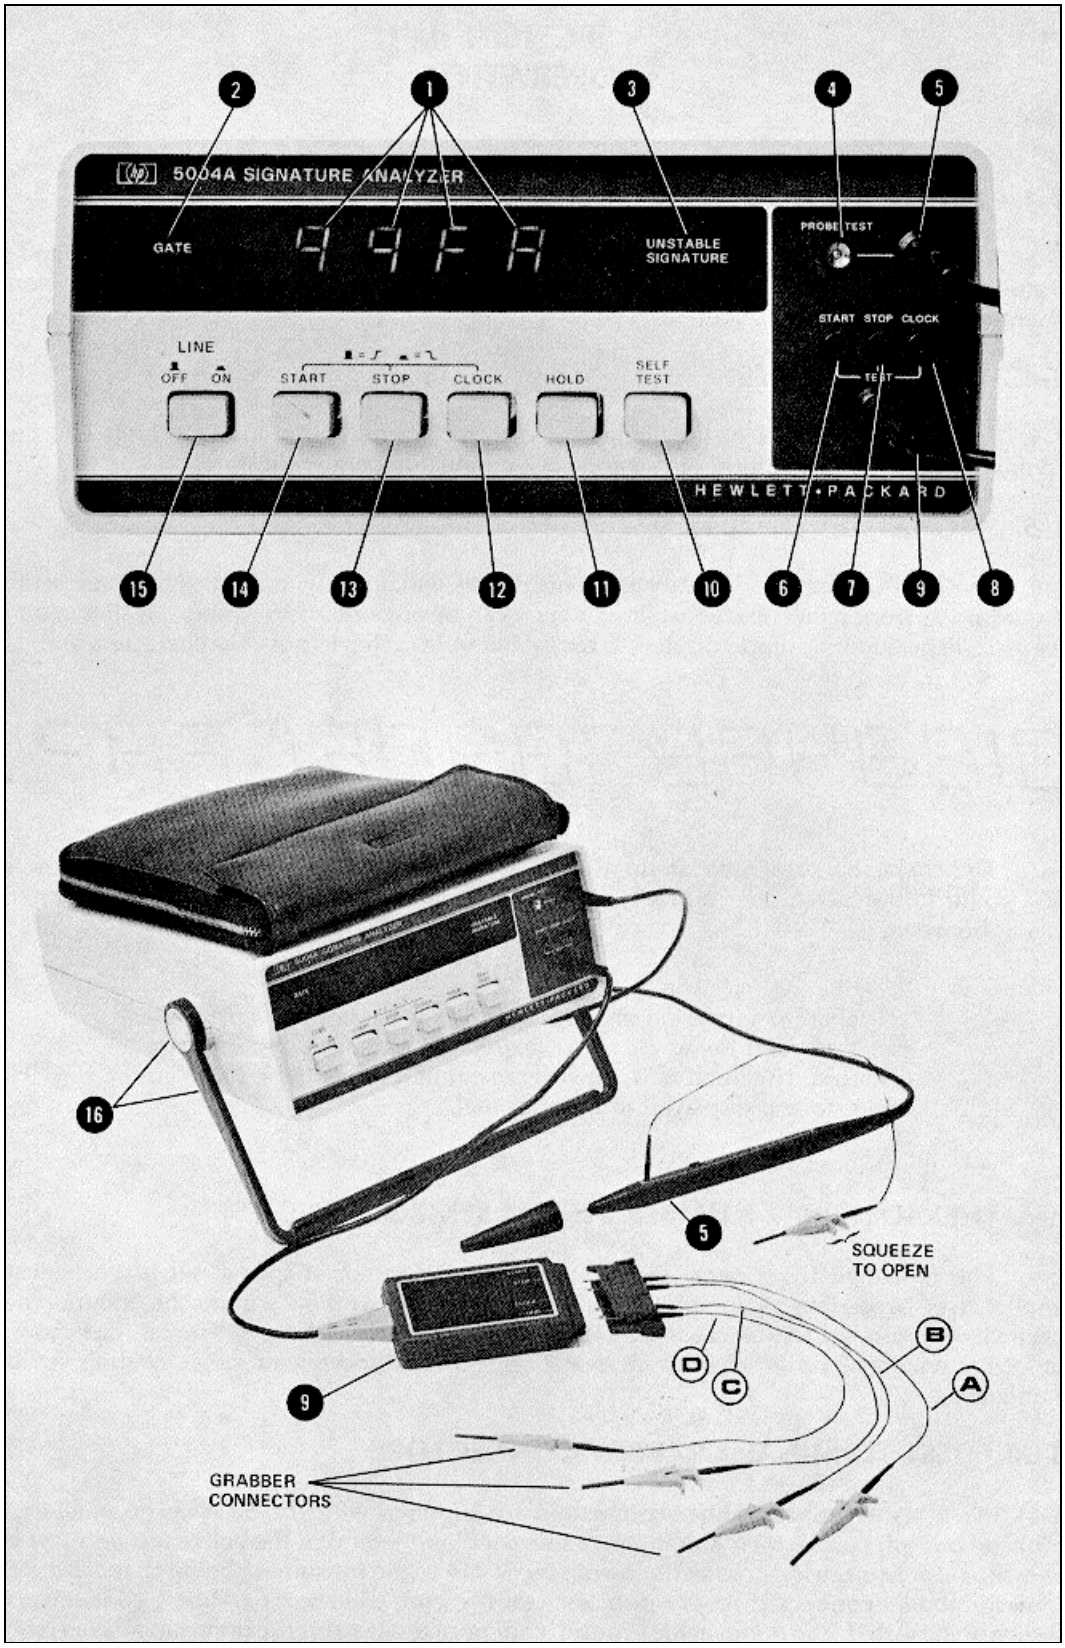

Figure 3-1. Front Panel, Probe, and Pod Features

FRONT PANEL FEATURES

1. FOUR-DIGIT DISPLAY: Shows the unique signaure stimulated by the input signals.
2. GATE Lamp: Regular blinking of GATE lamp indicates proper START/STOP gating signals.
3. UNSTABLE SIGNATURE Lamp: Intermittent or occasional blinking of this lamp indicates a difference between successive signatures inputted to the 5004A.
4. PROBE TEST Connector: Test point for 5004A data probe in SELF-TEST mode.
5. DATA PROBE: Point of entry for data from unit being tested by 5004A. Lamp near probe tip indicates logic level at tip: On Bright = High, On Dim = Bad-level, Off = Low, 10 ns or greater pulses are stretched to 100 ms. Note side ground connector for fast circuits and RESET switch.
6. START Test Point: Test point for the START test connector on the active pod in the SELF-TEST mode.
7. STOP Test Point: Test point for the STOP test connector on the active pod in the SELF-TEST mode.
8. CLOCK Test Point: Test point for the CLOCK test connector on the active pod in the SELF-TEST mode.
9. Active Test Pod: Four test inputs START, STOP, CLOCK, and a common GND (ground) are extended with this active pod for fast rise time signals and low circuit loading.

(A) START Test Lead: Point of entry for START signal from the unit being tested by the 5004A.

(B) STOP Test Lead: Point of entry for STOP signal from the unit being tested by the 5004A.

(C) CLOCK Test Lead: Point of entry for CLOCK signal from the unit being tested by the 5004A.

(D) GND Test Lead: Common (ground) test lead for connection to unit being tested by the 5004A.

SWITCH NOTE

The following six switches 10, 11, 12, 13, 14, and 15 are all pushed once to lock in-on and push again to release out-off switches.

10. SELF-TEST Switch: When pushed and locked in, this test puts the 5004A in the SELF-TEST mode. (See SWITCH NOTE above.)
11. HOLD Signature Switch: When pushed and locked in, this switch will hold a single, one-time signature for comparison or recording. (See SWITCH NOTE above.)
12. 13. 14. CLOCK, STOP, and START Switches: These three switches are set to select either the positive-going (▀▁ ▪ ⨍) (indicates switch position) transition or the negative-going (▁▀ ▫ ⨍) (indicates switch position) transition of the respective signals as the active control for that signal. The CLOCK, STOP, and START switches are respectively the active control switches for the CLOCK, STOP, and START test inputs on the active pod. (See the SWITCH NOTE.)
15. LINE ▀ OFF ▁ ON Switch: (Indicates switch position.) This switch controls application of mains line power to the 5004A. Line power is applied when the switch is pushed and locked in. Line power is disconnected when the switch is out. (See SWITCH NOTE.)
16. Handle-Stand: The combination handle and stand can be rotated by pulling gently at the side pivot points both sides simultaneously and turning the handle to the desired position.

Figure 3-1. Front Panel, Probe, and Pod Features (Continued)

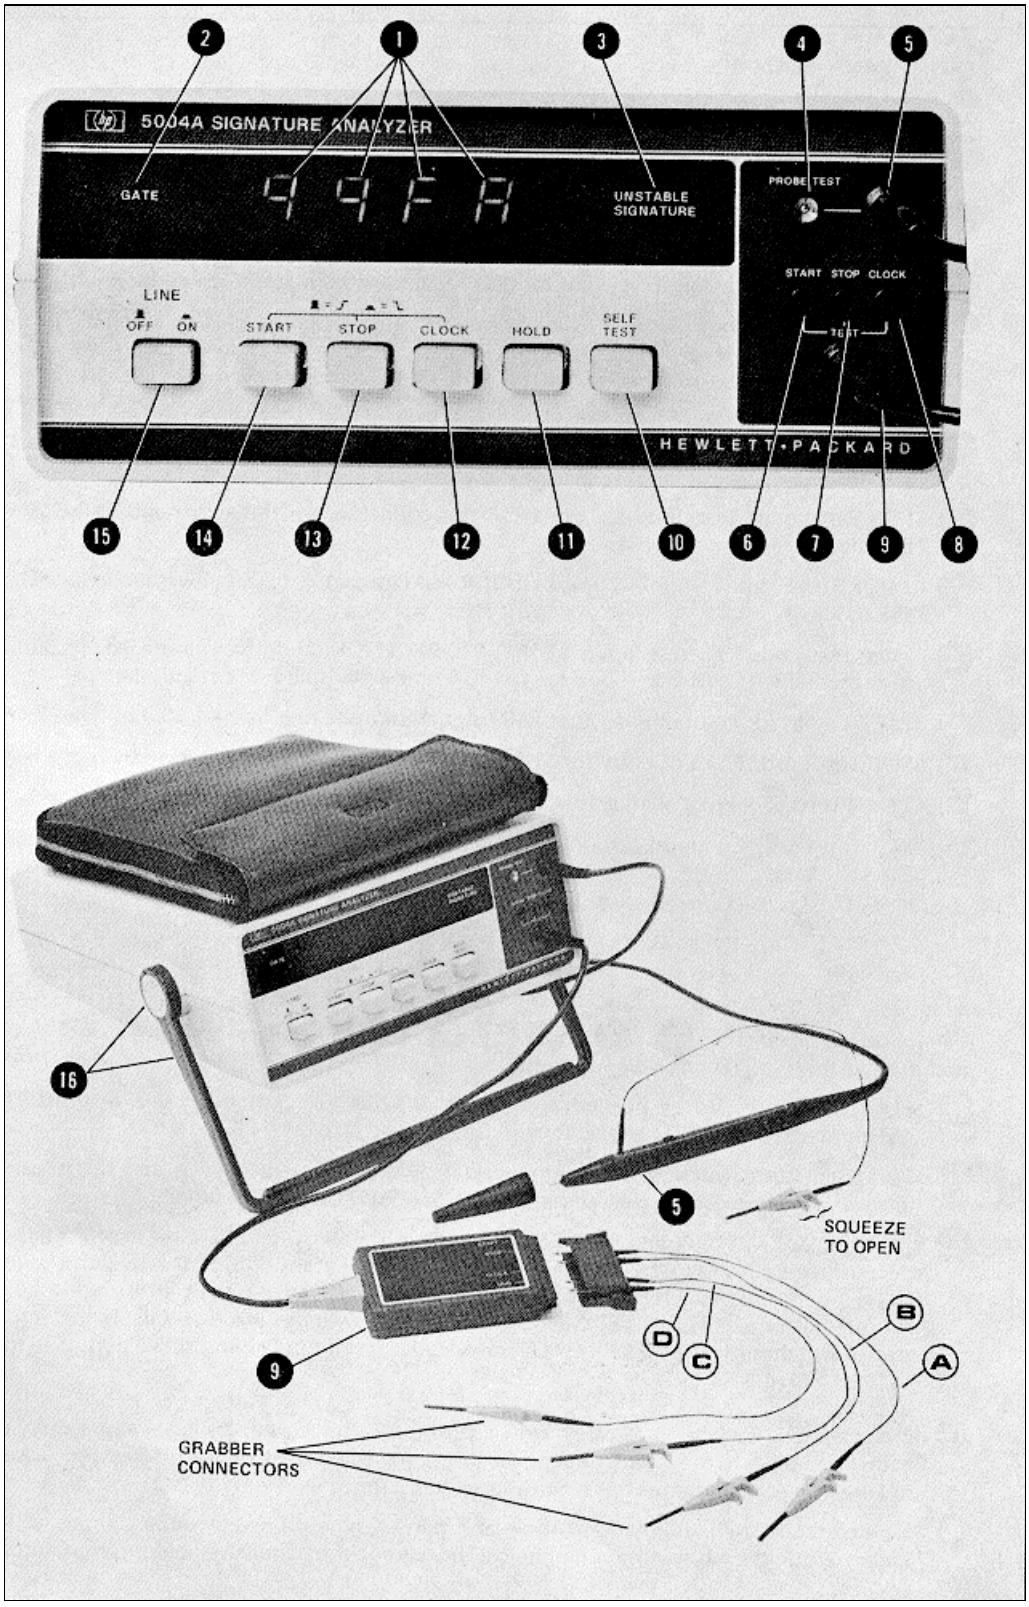

Figure 3-2. Operator Self-Test

3-12. OPERATOR'S MAINTENANCE

3-13. There are no operator's maintenance procedures for the 5004A.

FUSE NOTE

The 5004A power line fuse is inside the cabinet. If a 5004A seems to NOT operate as if a fuse were blown refer the unit to qualified maintenance personnel.

3-14. OPERATOR SELF-TEST of 5004A

3-15. The 5004A Signature Analyzer has a SELF-TEST (front panel switch) mode which can be used to check the condition of the unit thoroughly. Use the procedure in Figure 3-2 to SELF-TEST a 5004A.

1. Before applying power to the 5004A check that the line (mains) voltage available matches the label on the 5004A rear panel.

CAUTION

THE 5004A HAS INTERNALLY-SWITCHABLE OPTIONAL DIFFERENT POWER LINE VOLTAGES. REFER TO SECTION V FOR LINE VOLTAGE CHANGE PROCEDURE.

2. Remove the grabber connectors from the pod test leads, and connect the pod (START, STOP, and CLOCK) leads to the matching START, STOP, and CLOCK receptacles on the 5004A front panel.
3. Connect the 5004A data probe to the PROBE TEST receptacle on the 5004A front panel. Push the probe tip point gently and firmly into the PROBE TEST receptacle until the point is held securely.
4. Connect the 5004A power cable to the correct power source and set the 5004A front panel as follows for the displays shown:

Switch Settings			Displays			
START	STOP	CLOCK	Four Seven-Segment (See Note)	GATE	UNSTABLE SIGNATURE	PROBE TIP LIGHT
(in) ⌐¯	(in) ⌐¯	or ⌐¯ ¯⌐	UP73 then ACA2	flickers	Flickers except when good signature is on	Flickers when "ACA2" is on
(out) ¯⌐	(out) ¯⌐	or (out) ¯⌐ (in) ⌐¯	3951 then 2P61	flickers	Flickers except when good signature is on	Flickers when "2P61" is on

NOTE

In SELF-TEST mode the four 7-segment displays first have all seven segments lit dimly, 8 , for about 1-second (tests all segments) and then have one of the signature sets listed above for about 1-second. If the probe RESET switch is pressed during the SELF-TEST mode, the four 7-segment-digit displays will show 0000 (all zeros) except when all segments are dimly lit 8888

CAUTION

THE 5004A HAS INTERNALLY-SWITCHABLE OPTIONAL DIFFERENT POWER LINE VOLTAGES. REFER TO SECTION V FOR LINE VOLTAGE CHANGE PROCEDURE.

Figure 3-2. Operator Self-Test (Continued)

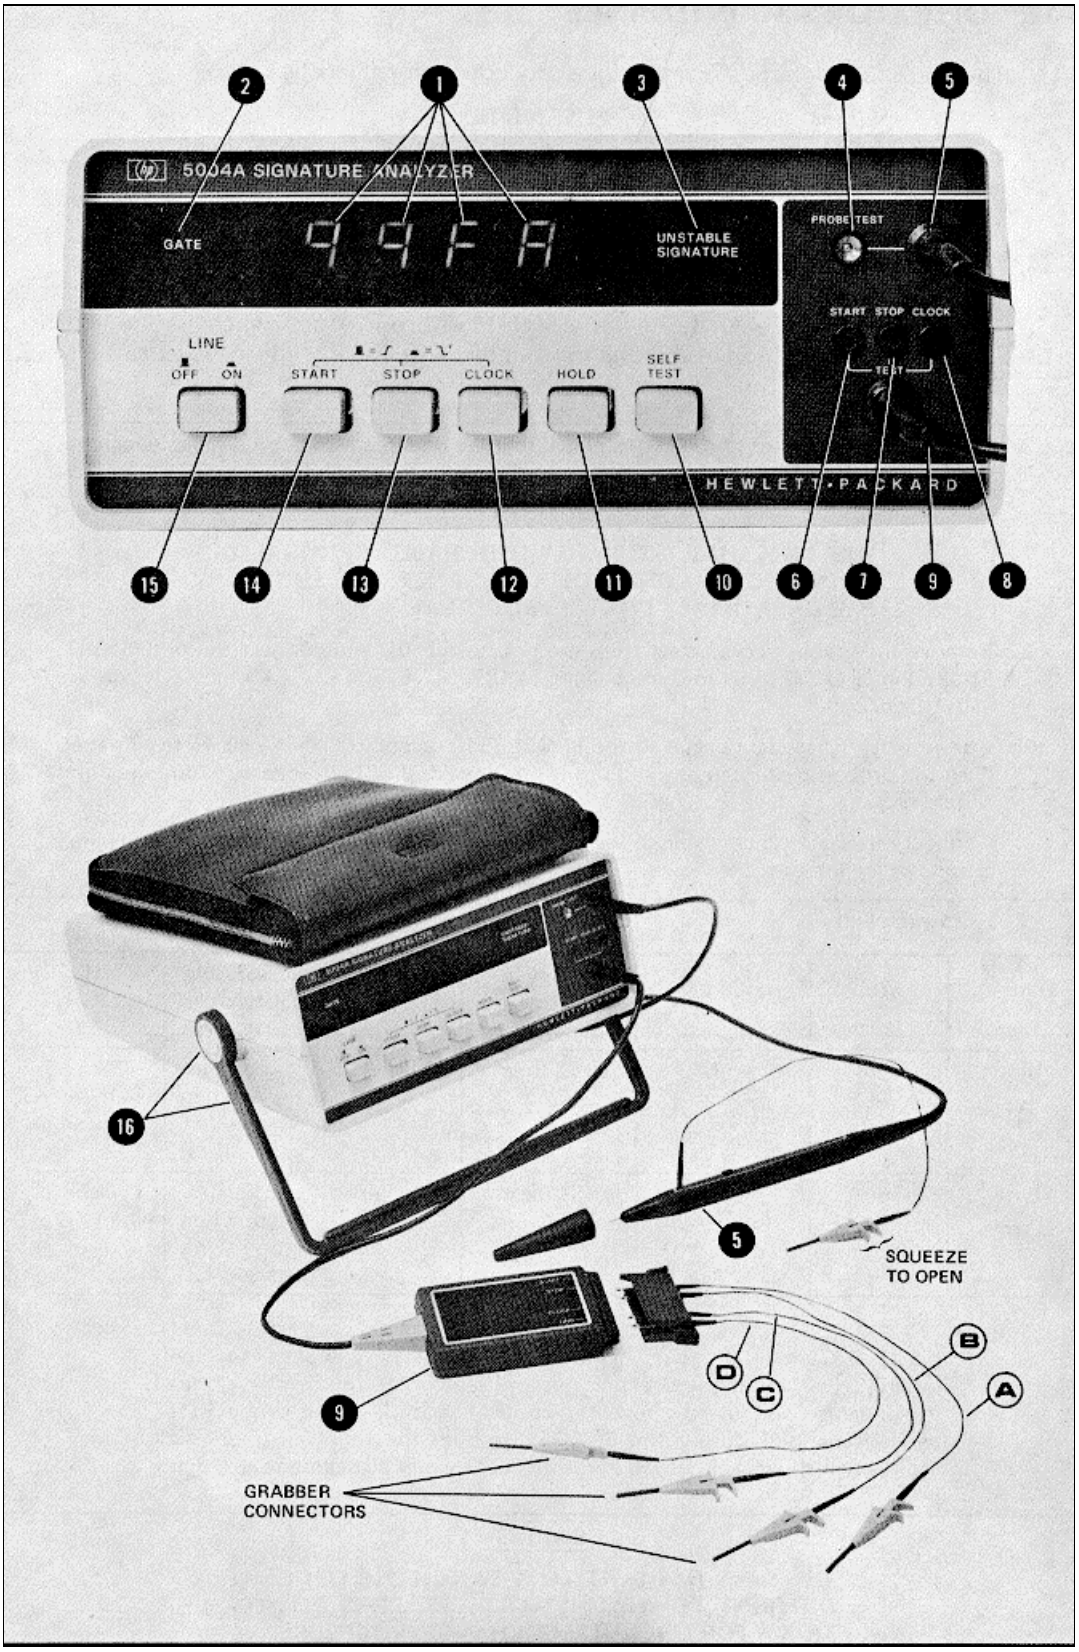

Figure 3-3. Operating Instructions

3-16. INSTRUMENTS COMPATIBLE WITH 5004A

3-17. The 5004A is used to check the operation of electronic digital logic instruments with built-in capability to be tested with the signature analysis method. Instruments to be checked by the 5004A must be compatible with the 5004A. Refer to the specifications and other details in Section I of this manual for compatibility information.

3-18. OPERATING INSTRUCTIONS

3-19. Figure 3-3 shows operating procedures for the 5004A Signature Analyzer. Refer to the instruction manual of the instrument to be tested for detailed steps for use of the 5004A Signature Analyzer.

OPERATING INSTRUCTIONS

1. Before applying power to the 5004A study and learn the information given in *Figure 3-1*, Front Panel Features and perform the Operators Self-Test in *Figure 3-2*.
2. Refer to the instruction manual for the instrument or system to be tested.

NOTE

Correct (expected) "signatures" for the device under test (D.U.T.) must be known for proper use of the 5004A. Signatures will usually be in the troubleshooting section of the D.U.T. manual.

3. Connect the 5004A START, STOP, CLOCK, and GND test inputs (9) on the test pod to the specified test points of the D.U.T. (Refer to D.U.T. manual.)
4. Set the 5004A front panel START (14), STOP (13), and (12) CLOCK ▮= ⎍ ▬ ⎏ (edge select) switches as stated in the D.U.T. manual.

NOTE

The edge select switches allow flexibility in selection of START and STOP signals. For example, one long pulse can be used for both START and STOP if the rising edge is START and the falling edge is STOP.

NOTE

The (11) HOLD and (10) SELF-TEST switch buttons should normally be in the out position.

5. Use the 5004A Data Probe (5) to check the signature nodes of the D.U.T., and compare the signatures found with the signatures given in the D.U.T. manual.

NOTE

Especially when slow clock signals are used, the first one or two signatures displayed may be wrong. Two successive identical signatures indicate the signature of that point.

6. If one or more incorrect signatures are found, refer to the troubleshooting procedures in the DUT manual.

NOTE

If most or all signatures are incorrect, check the preliminary settings given in the DUT manual.

NOTE

Using the HOLD function (HOLD switch (11) in) allows observation of a signature occurring once. (The DATA PROBE (5) RESET switch will erase a HELD signature.)

Figure 3-3. Operating Instructions (Continued)

3-20. TYPICAL CONNECTIONS OF 5004A TO DEVICE UNDER TEST

3-21. Figure 3-4 shows the 5004A Signature Analyzer connected to another device to take "signatures"

CAUTION

The black finned heat sink on the rear of the cabinet is "grounded" (connected) to the power line "earth" terminal.

NOTE

The bottom of the 5004A is insulating plastic material so it will not cause any electrical short circuits.

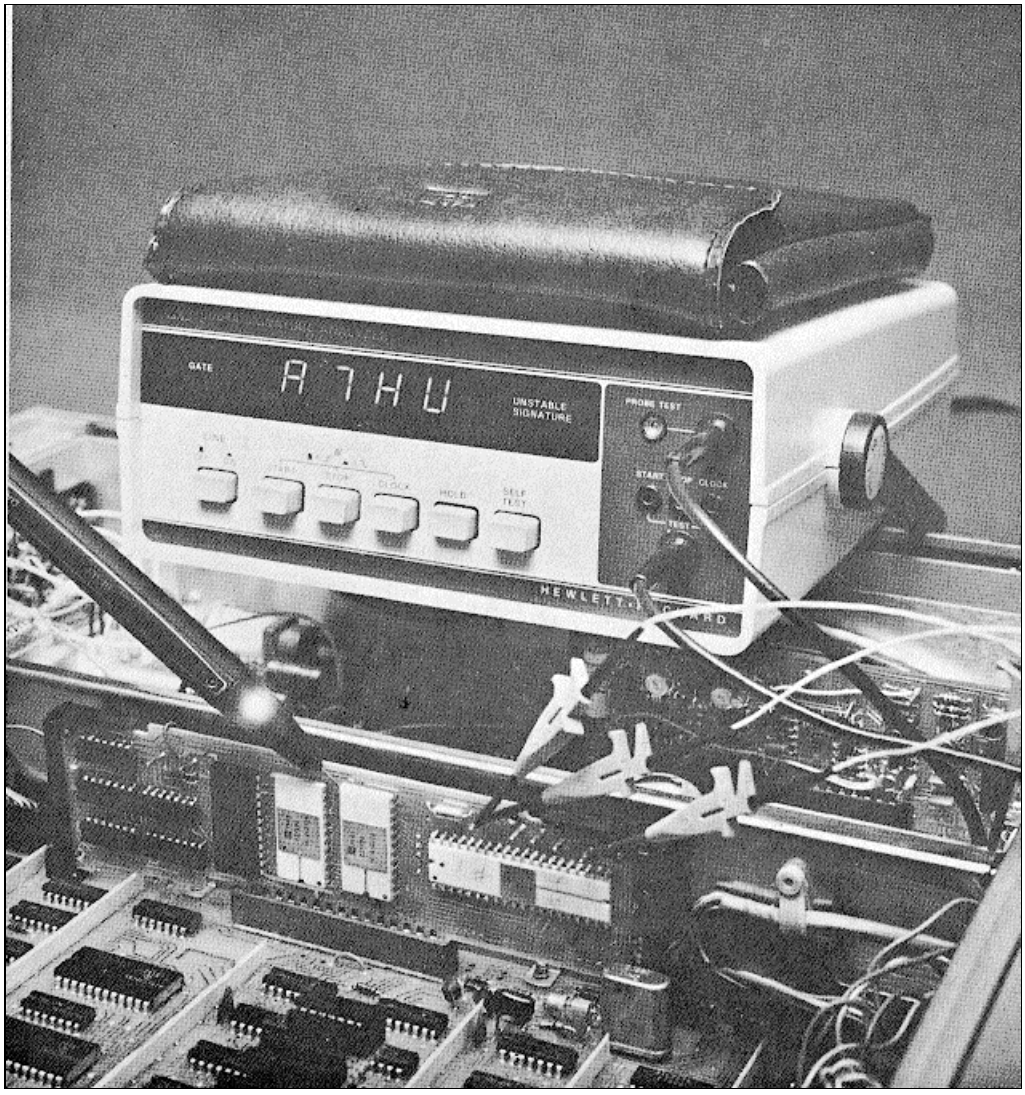

Figure 3-4. Typical Connections of 5004A to Device Under Test

3-22. PROBE, POD, AND POWER CABLE STORAGE

3-23. Figure 3-5 shows the gating signals pod, data probe, line power cable in the recommended storage positions. The storage case on top of the 5004A should be used to store these components when the 5004A is not in use or is being transported.

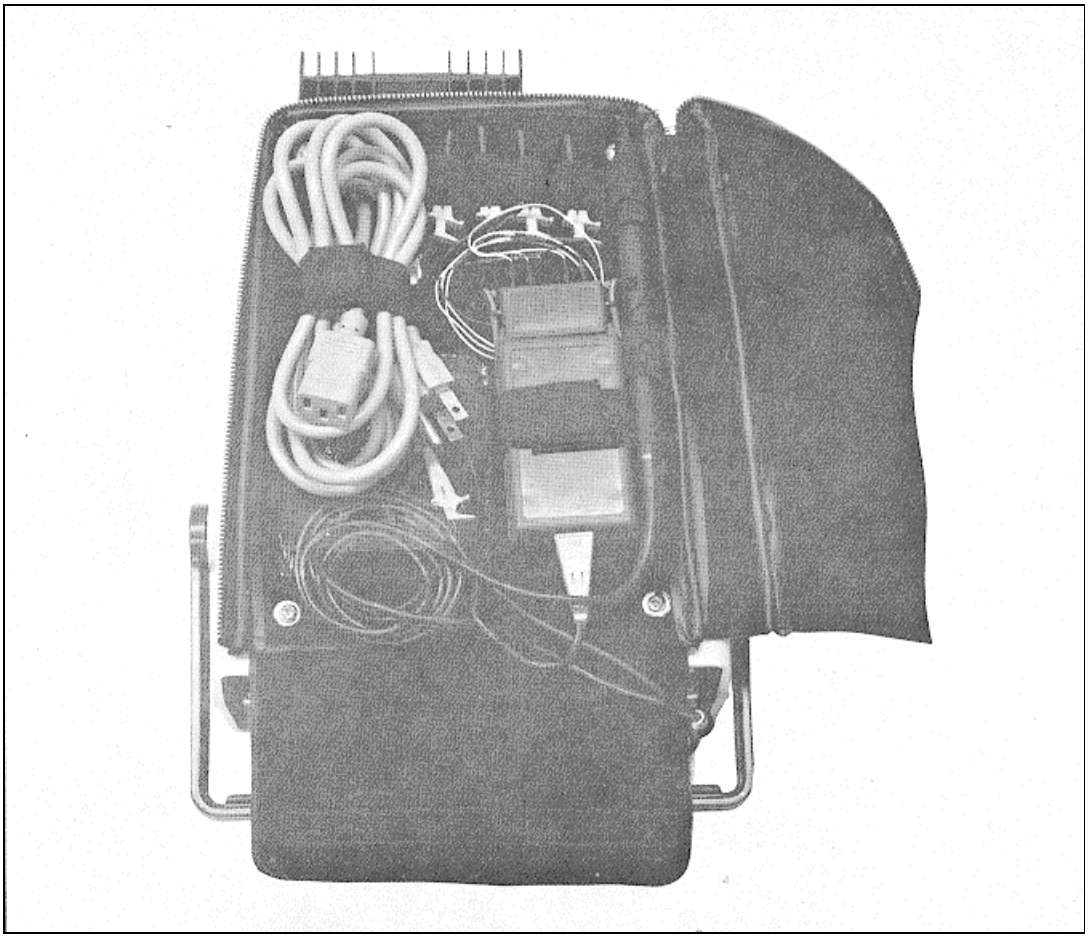

Figure 3-5. Probe, Pod, and Power Cable Storage

3-24. TROUBLESHOOTING WITH THE 5004A SIGNATURE ANALYZER

3-25. Digital instruments designed to be serviced with Signature Analysis will have a listing of correct signatures available either in a service manual or in some other form (e.g., a listing of correct signatures and conditions could be printed on an instrument top or bottom cover, or on a card inside the cabinet). Whatever form the list takes the Signature Analyzer can be used in much the same manner as a meter or oscilloscope to trace correct signals.

NOTE

A system with signatures will usually be setup so data paths can be signature checked in "signal tracing" fashion.

3-26. The traditional "half-split" method of signal tracing can be used with a Signature Analyzer.

SECTION IV
PERFORMANCE TESTS

4-1. INTRODUCTION

4-2. The procedures in this section test the instrument's electrical performance using the specifications of Table 1-1 as the performance standards. All tests can be performed without access to the interior of the 5004A. A simpler operational test is included in Section III under Operator's Check.

4-3. TEST EQUIPMENT REQUIRED (see Table 4-1)

Table 4-1. Required Test Equipment

INSTRUMENT	CRITICAL SPECS	RECOMMENDED HP MODEL
Pulse Generator	5 ns-100 ns delay	8007B
Pulse Generator	10 MHz, 5 volts pulse	8013B
Oscilloscope with dual-trace vertical amp.	100 MHz	182C, 1805A/1825A
Power Supply	5 volts	6111A
Digital Voltmeter	10 volts	3476A
Resistor	1000Ω 5% 1/4W	0683-1025
Resistor	50Ω 5% 2W	0698-3311
Capacitor	0.1 μF ±20% 25V	0170-0022
Capacitor	10 μF +75 -10% 25V	0180-0059

4-4. LOGIC LEVEL PERFORMANCE TEST

4-5. With test equipment connected as shown in Figure 4-1, proceed as follows:

a. Turn power ON on 5004A, all other switches OUT.
b. Adjust the 6111A Power Supply to 0 volts. Probe indicator light should be off.
c. Vary the Power Supply until probe indicator just light up dimly. Probe tip voltage should be +0.8V, +0.3V, -0.2V.
d. Increase power supply voltage until indicator reaches full brilliance. Probe tip voltage should be 2.0V, +0.2V, -0.3V.
e. Disconnect test equipment.

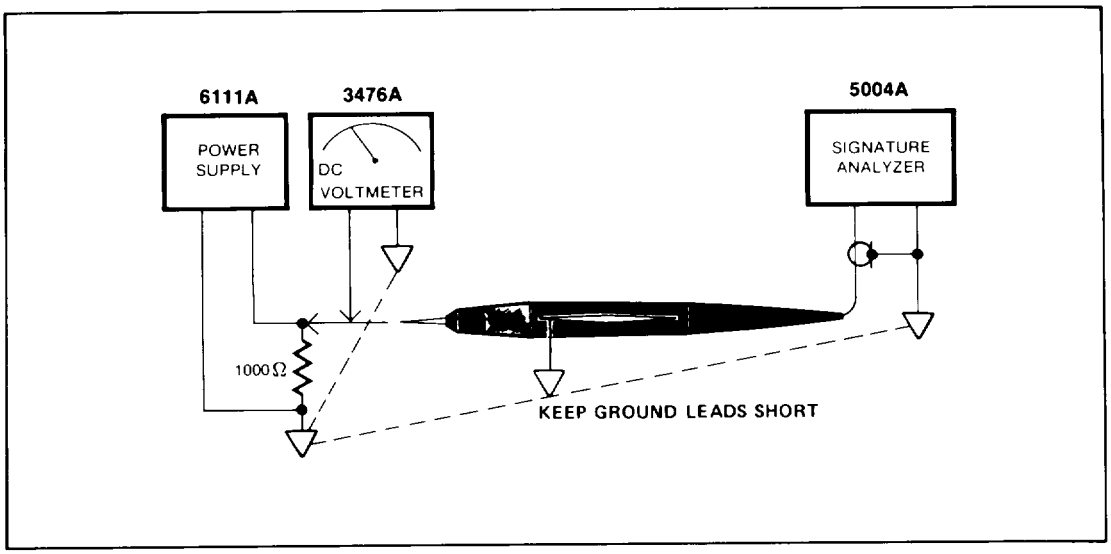

Figure 4-1. Logic Level Performance Test Setup

4-6. POSITIVE PULSE PERFORMANCE TEST

4-7. With test equipment connected as in Figure 4-2, proceed as follows:

a. Set Pulse Generator to output a positive-going 5-volt/10 ns pulse.
b. Set Pulse Generator repetition rate to approximately one-pulse-per-second. The probe indicator should flash once every second.
c. Disconnect test equipment.

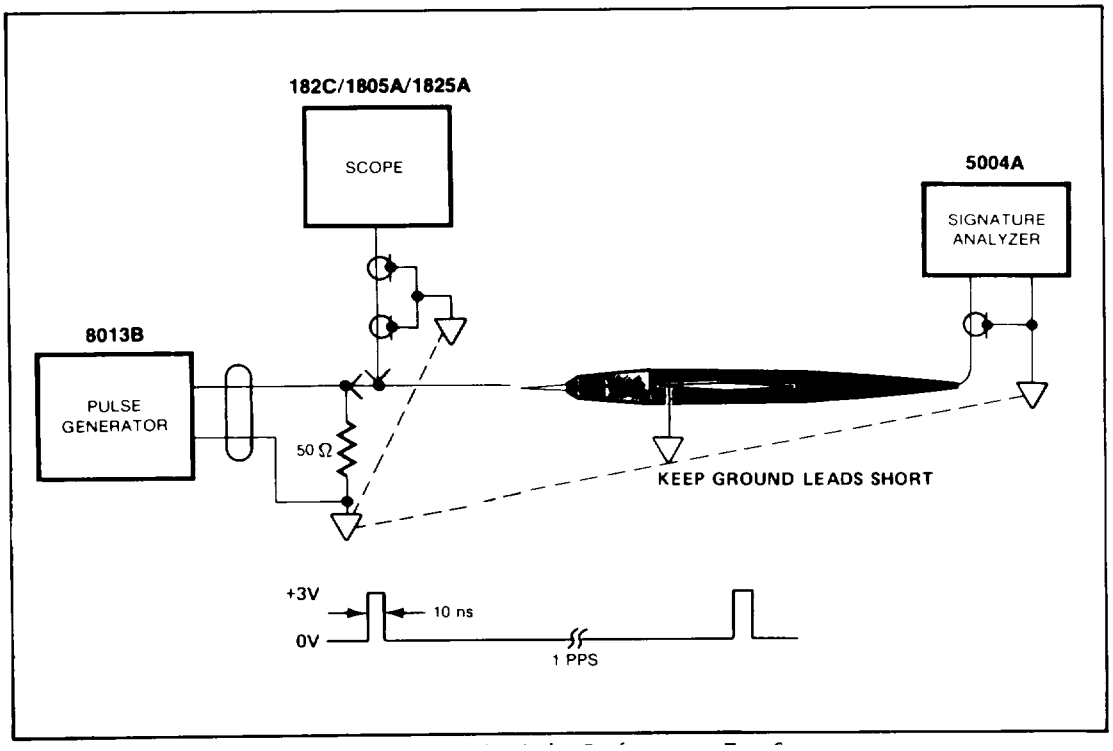

Figure 4-2. Positive Pulse Performance lest setup

4-8. NEGATIVE PULSE PERFORMANCE TEST

4-9. With test equipment connected as in Figure 4-3, proceed as follows:

a. Set pulse generator to output a negative-going pulse.
b. Adjust pulse generator to give waveform at probe tip as shown in Figure 4-3, with a repetition rate of one-pulse-per-second. Probe indicator should flash off approximately once per second.
c. Disconnect test equipment.

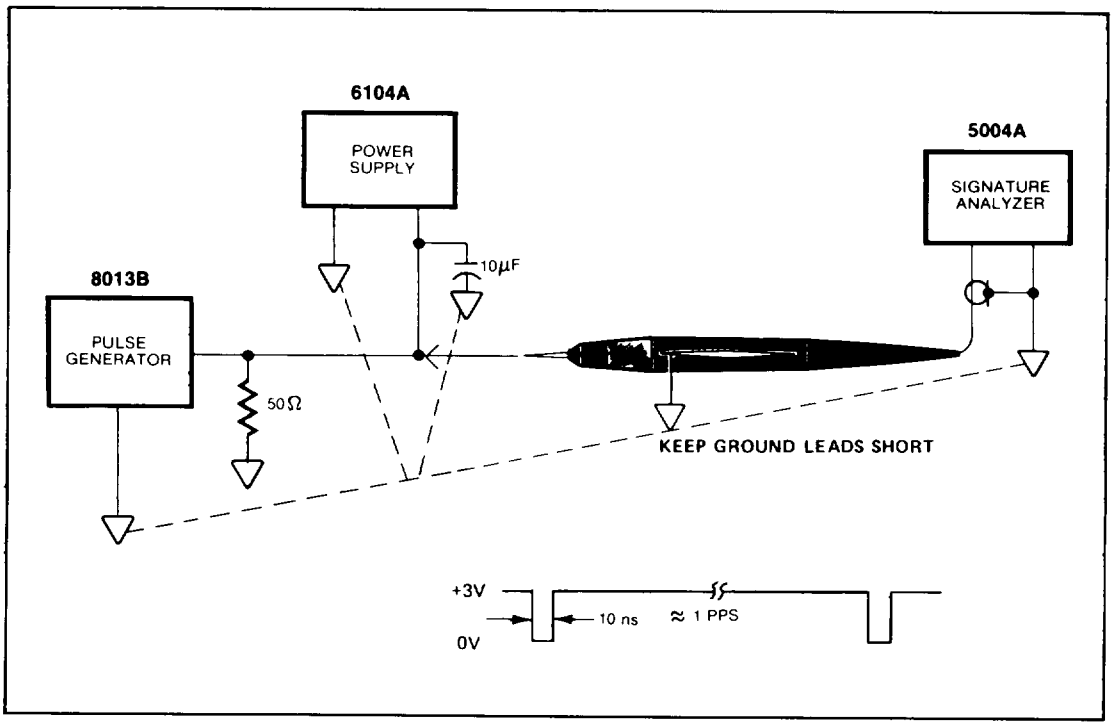

Figure 4-3. Negative Pulse Performance Test Setup

4-10. DATA PROBE SETUP TIME PERFORMANCE TEST

4-11. Connect the equipment as shown in Figure 4-4. Equipment front panel settings:

8013B Front Panel Settings:
Pulse period = 200 ns (5 MHz) in 20 n position
Pulse width = square wave
Amplitude = 5V.

NOTE

Adjust the 8007B pulse width to obtain approximately the same pulse period of 8013B throughout the frequency range.

8007B Front Panel Settings:
External Input - Ext. Trigger
Pulse delay - 5.0 ns position
Pulse width - 5.0 ns position
Slope Polarity +
Transition time - 2.0 ns Leading edge: Fully CCW. Trailing edge: Fully CCW
Symm/Norm/Compl - NORM
Amplitude = +5V
Output Pulse Polarity +

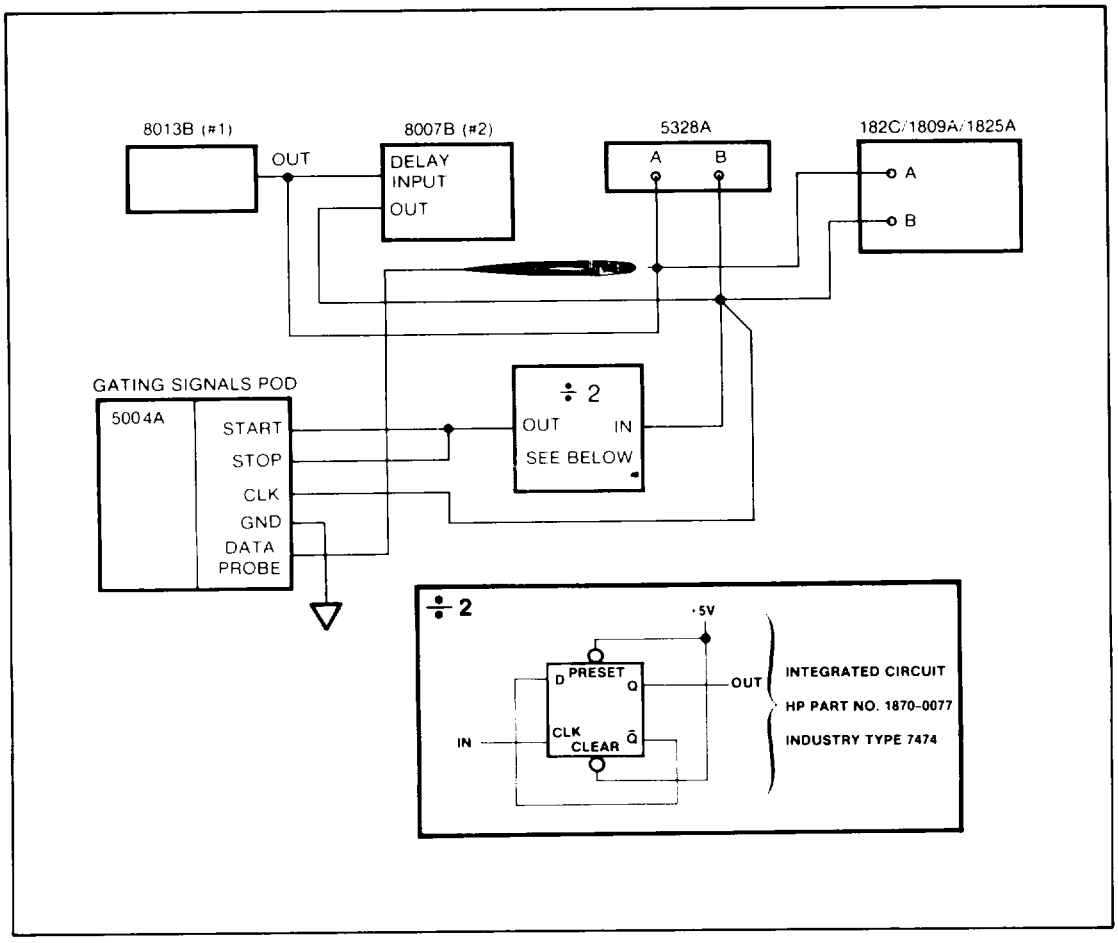

Figure 4-4. Data Probe Setup Time Performance Test

5328A with Options 040 and 021 Settings:
Function switch TI AVG A-B
Frequency Resolution 106
Trigger level 1.40 volts
Slope -
CH A +
CH B +
Attenuator -
CH A X1, DC Trig.
CH B X1, DC Trig.
COM switch - SEP
Z_{IN} - 1 MΩ

Oscilloscope 182C/1809A/1825A Settings (the two coax cables must be same length):
Volt/Div - 2V
50 ns/div (positive edge)
50Ω termination

5004A Logic Tracer Settings:
START, STOP, CLOCK, HOLD, SELF-TEST buttons OUT
LINE OFF/ON - ON

Test Procedure:

1. Adjust the 8007A Pulse Width vernier to approximately midrange.
2. Set the 8007B Pulse Delay vernier to a minimum (CCW). The 5004A Signature Analyzer display should be all zeros (0000).
3. Turn the 8007B Pulse Delay vernier slowly clockwise until the display on the 5004A is 0003; the counter display will be <15 ns.
4. On the 5004A Signature Analyzer, push the START and STOP buttons IN. Repeat steps 2 and 3 above. The counter display will be <15 ns.
5. On 5004A Signature Analyzer, push the START or STOP button IN. Repeat step 2. Turn the 8007B Pulse Delay vernier slowly clockwise until the display on the 5004A is 0001; the counter display will be <15 ns. The display is also indicative of the minimum gate time (one clock pulse between START and STOP signals).
6. Set 5328A Universal Counter FUNCTION switch to FREQ A. Set 5004A Signature Analyzer START and STOP switches OUT ( ).
    a. On 8013B Pulse Generator change the pulse period to 100 ns. Counter display should read 10 MHz.
    b. Set 5328A Universal Counter FUNCTION switch to TI AVE A $\rightarrow$ B.
    c. On 8007B Pulse Generator change the Pulse Delay and Pulse Width switches to the 5 ns position.
    d. Repeat steps 2 and 3.
7. Vary the frequency of 8013B Pulse Generator from 1 Hz to 10 MHz. Adjust the 8007B Pulse Width to obtain approximately the same pulse width of 8013B throughout the frequency range. Results should be as in step 3.
8. Disconnect test equipment.

4-12. DATA PROBE HOLD TIME PERFORMANCE TEST

4-13. With test equipment connected as in *Figure 4-4*, and settings as in "SETUP TIME PERFORMANCE TEST" proceed as follows:

1. Set the counter's Channel A slope to "-". Set scope's time base to negative edge.
2. Set the 5328A Universal Counter FUNCTION switch to FREQ A position. Set the 8007B Pulse Delay vernier to near midrange; the counter's displays should be 1.00000. The display of the 5004A Signature Analyzer should be 0003. Change 5328A FUNCTION switch to TI AVG A $\rightarrow$ B. The counter reading should be zero nanoseconds. Turn the Pulse Delay vernier slowly clockwise until the 5004A display reads 0000. The counter will read greater than zero nanosecond, indicating that the data doesn't have to remain valid after the clock pulse occurs.
3. Vary the frequency of 8013B Pulse Generator from 1 Hz to 10 MHz. Adjust the 8007B Pulse Width to obtain approximately the same duty cycle of 8013B throughout the frequency range. Results should be as in step 2.
4. Disconnect test equipment.

4-14. TEST RECORD

4-15. *Table 4-2* is a blank performance test record which may be duplicated and used to keep a permanent periodic record of the performance of a 5004A Signature Analyzer.

Table 4-2. Performance Test Record

HEWLETT-PACKARD COMPANY *Date:* _____

SECTION V
ADJUSTMENTS

5-1. INTRODUCTION

5-2. This section describes adjustments that may be made to the 5004A. Only two adjustable functions exist. The power transformer primary is switchable to allow selection several different line voltages, and the data probe input threshold voltage is adjustable to allow the exactly correct value to be set. The 5004A top cover must be removed to change the power transformer primary (line voltage change). The data probe covers must be removed to set the threshold. Refer to disassembly procedures in Section VIII for cover removal information.

NOTE

The data probe threshold voltage should be checked when any parts are replaced in the data probe or when the power supply +5-volt regulator is replaced.

5-3. DATA PROBE THRESHOLD VOLTAGE CHECK AND ADJUSTMENT

5-4. Use the following procedure to check and adjust the data probe threshold voltage. Refer to the recommended test equipment listed in Section for units necessary in this procedure.

a. Refer to the disassembly procedures in Section VIll, and remove the data probe covers. Refer to the parts location figure and schematic diagram in Section VIII for other information necessary for this procedure.
b. Connect the negative test lead of the DVM to the Data Probe U2(1), and connect the positive test lead to U1(7). Record this voltage (Vcc).
c. Connect the positive test lead to U1(5). Compare this voltage with the Vref voltage corresponding to the Vcc (step b) on Figure 5-1.
d. If necessary, adjust potentiometer R4 so the Vref voltage corresponds to Vcc voltage taken in step b.

NOTE

Figure 5-1 is a graph relating the U1 pin 5 voltage to U1 pin 7 voltage.

e. Repeat steps b, c, and d.
f. Disconnect the test equipment, and reassemble the data probe covers.

5-5. POWER TRANSFORMER PRIMARY LINE VOLTAGE CHANGE PROCEDURE

5-6. Use the following procedure to change the power transformer primary line voltage switches settings.

a. Refer to the disassembly procedure in Section VIII, and remove the 5004A top cover.

WARNING

DISCONNECT THE LINE POWER CABLE FROM THE 5004A.

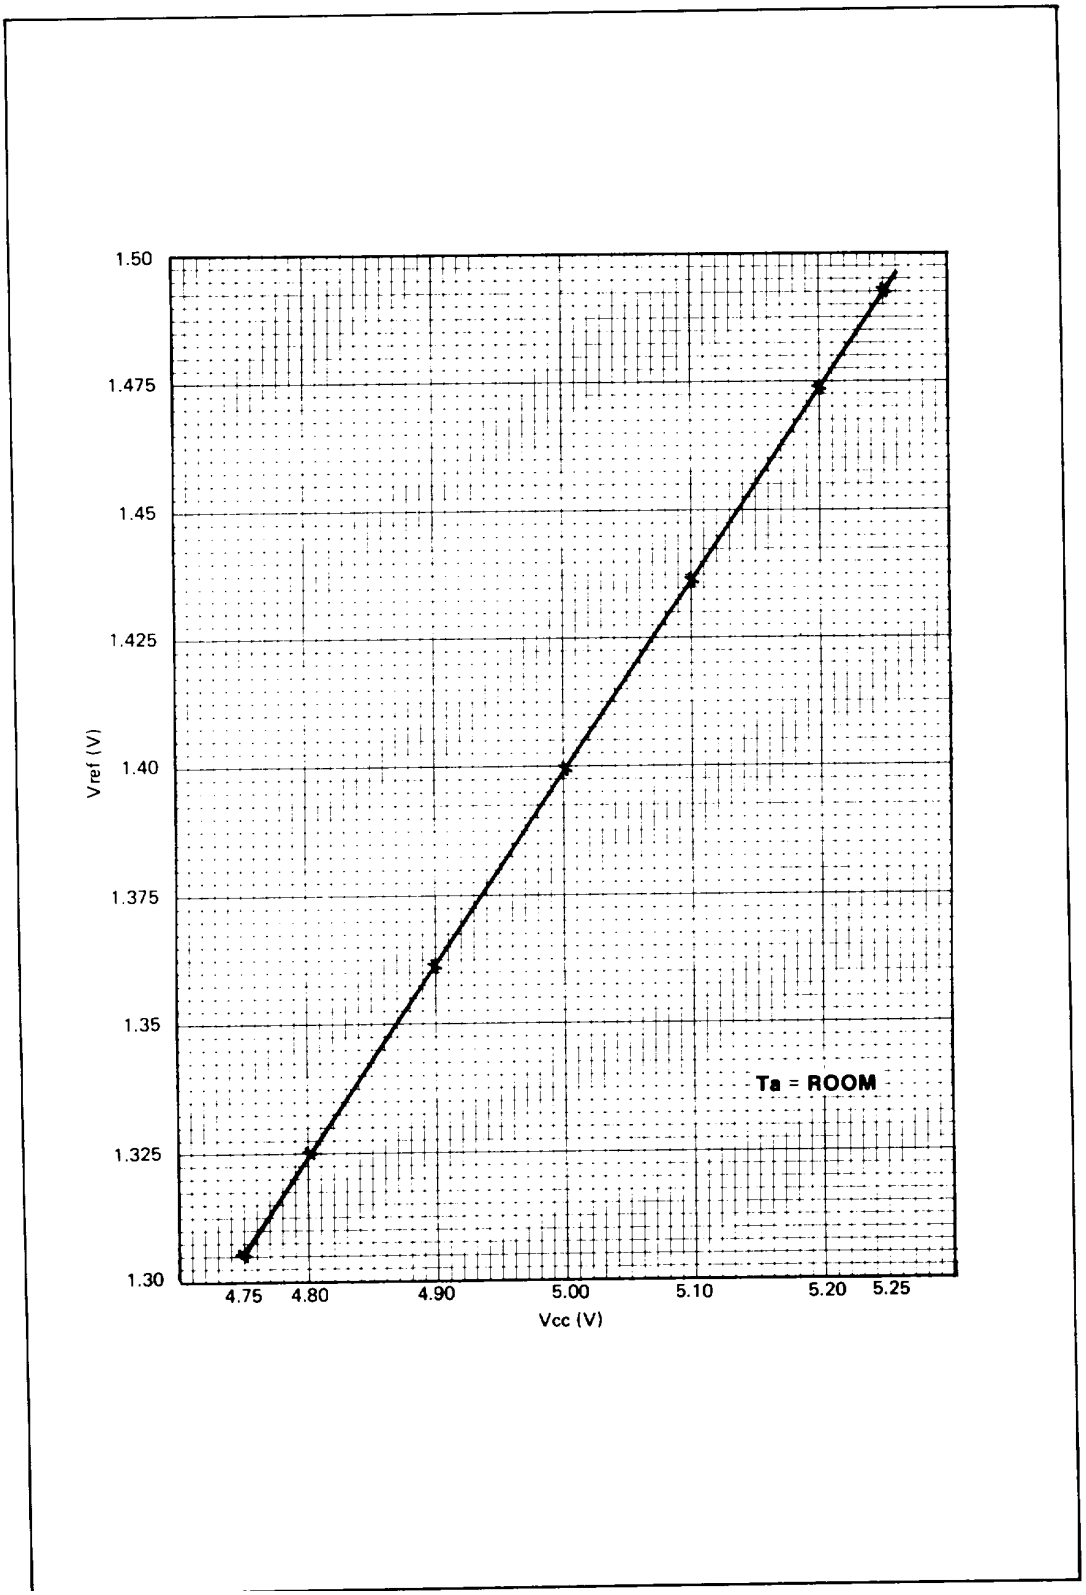

Figure 5-1. Data Probe V_{CC}-Vref Graph

b. Refer to Figure 5-2 which shows the line fuse holder and the line voltage selection switches. Both switch indicators must be set to the line voltage selection marks to match the available line voltage.

NOTE

The possible line voltage range are listed in Section I, Specifications. Refer to this list to decide where the selection switches should be set.

c. Set the line voltage switches to appropriate positions for the available line voltage.

CAUTION

Check the line fuse, Fl. It must correspond to the line voltage selected. Refer to the specifications in Section VI for the correct value fuse.

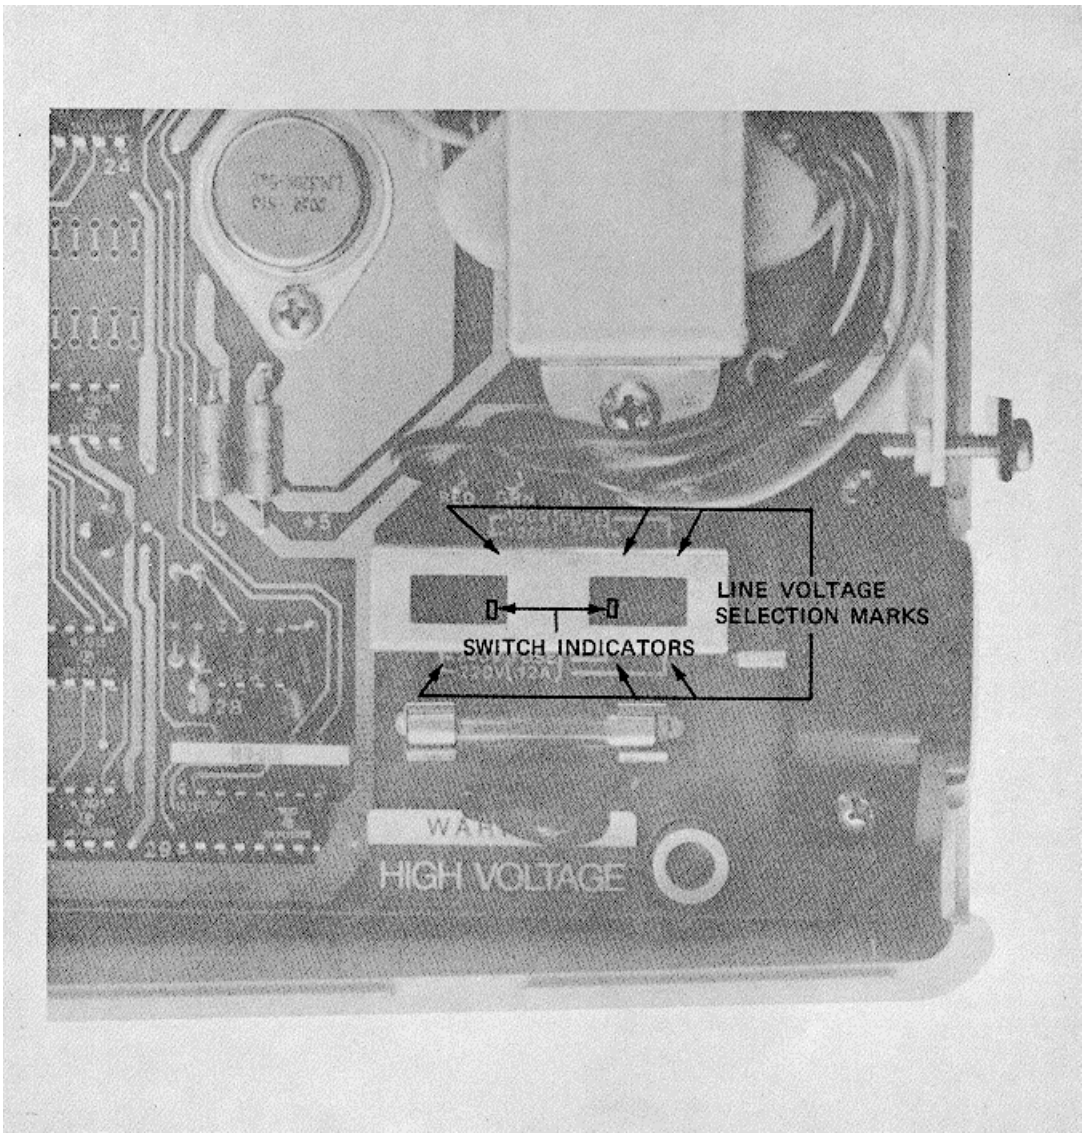

Figure 5-2. Fuse and Line Voltage Selection

SECTION VI
REPLACEABLE PARTS

6-1. INTRODUCTION

6-2. This section contains information for ordering replacement parts. Table 6-1 lists parts in alphanumerical order of their reference designators and indicates the description and HP Part Number of each part, together with any applicable notes. The table includes the following information.

a. Description of part (see abbreviations below).
b. Typical manufacturer of the part in a five-digit code; see list of manufacturers in Table 2.
c. Manufacturer's part number.
d. Total quantity used in the instrument (Qty column).

REFERENCE DESIGNATIONS

A	= assembly	E	= micellaneous electrical part	P	= electrical connector (movable portion); plug	V	= electron tube

NPO	= negative-positive zero (zero temperature coefficient)
NRFR	= not recommended for field replacement
NSR	= not separately replaceable
ns	= nanosecond
nW	= nanowatt
OBD	= order by description
OD	= outside diameter
OH	= oval head
OP AMPL	= operational amplifier
OPT	= option
OSC	= oscillator
OX	= oxide
oz	= ounce
Ω	= ohm
P	= peak (used in parts list)
PAM	= pulse-amplitude modulation
PC	= printed circuit
PCM	= pulse-code moudulation; pulse-count modulation
PDM	= pulse-duration modulation
pF	= picofarad
PH BRZ	= phosphor bronze
PHL	= Phillips
PIN	= positive-intrinsic-negative
PIV	= peak inverse voltage
pk	= peak
PL	= phase lock
PLO	= phase lock oscillator
PM	= phase modulation
PNP	= positive-negative-positive
P/O	= part of
POLY	= polystyrene
PORC	= porcelain
POS	= positive; position(s) (used in parts list)
POSN	= position
POT	= potentiometer
p-p	= peak-to-peak
PP	= peak-to-peak (used in parts list)
PPM	= pulse-position modulation
PREAMPL	= preamplifier
PRF	= pulse-repetition frequency
PRR	= pulse repetition rate
ps	= picosecond
PT	= point
PTM	= pulse-time modulation
PWM	= pulse-width modulation
PWV	= peak working voltage
RC	= resistance capacitance
RECT	= rectifier
REF	= reference
REG	= regulated
REPL	= replaceable
RF	= radio frequency
RFI	= radio frequency interference
RH	= round head; right hand
RLC	= resistance-inductance-capacitance
RMO	= rack mount only
rms	= root-mean-square
RND	= round
ROM	= read-only memory
R&P	= rack and panel
RWV	= reverse working voltage
S	= scattering parameter
s	= second (time)
″	= second (plane angle)
S-B	= slow-blow (fuse (used in parts list)
SCR	= silicon controlled rectifier; screw
SE	= selenium
SECT	= sections
SEMICON	= semiconductor
SHF	= superhigh frequency
SI	= silicon
SIL	= silver
SL	= slide
SNR	= signal-to-noise ratio
SPDT	= single-pole, double-throw
SPG	= spring
SR	= split ring
SPST	= single-pole, single-throw
SSB	= single sideband
SST	= stainless steel
STL	= steel
SQ	= square
SWR	= standing-wave ratio
SYNC	= synchronize
T	= timed (slow-blow fuse)
TA	= tantalum
TC	= temperature compensating
TD	= time delay
TERM	= terminal
TFT	= thin-film transistor
TGL	= toggle
THD	= thread
THRU	= through
TI	= titanium
TOL	= tolerance
TRIM	= trimmer
TSTR	= transistor
TTL	= transistor-transistor logic
TV	= television
TVI	= television interference
TWT	= traveling wave tube
U	= micro (10^{-6}) (used in parts list)
UF	= microfarad (used in parts list)
UHF	= ultrahigh frequency
UNREG	= unregulated
V	= volt
VA	= voltampere
Vac	= volts ac
VAR	= variable
VCO	= voltage-controlled oscillator
Vdc	= volts dc
VDCW	= volts dc, working (used in parts list)
V(F)	= volts, filtered
VFO	= variable-frequency oscillator
VHF	= very-high frequency
Vpk	= volts peak
Vp-p	= Volts peak-to-peak
Vrms	= volts rms
VSWR	= voltage standing wave ratio
VTO	= voltage-tuned oscillator
VTVM	= vacuum-tube voltmeter
V(X)	= volts, switched
W	= watt
W/	= with
WIV	= working inverse voltage
WW	= wirewound
W/O	= without
YIG	= yttrium-iron-garnet
Zo	= characteristic impedance

NOTE

All abbreviations in the parts list will be in upper case.

MULTIPLIERS

Abbreviation	Prefix	Multiple
T	tera	10^{12}
G	giga	10^{9}
M	mega	10^{6}
k	kilo	10^{3}
da	deka	10^{1}
d	deci	10^{-1}
c	centi	10^{-2}
m	milli	10^{-3}
μ	micro	10^{-6}
n	nano	10^{-9}
p	pico	10^{-12}
f	femto	10^{-15}
a	atto	10^{-18}

6-4. ORDERING INFORMATION

6-5. To obtain replacement parts, address order or inquiry to your local Hewlett-Packard Sales and Service Office (see lists at rear of this manual for addresses). Identify parts by their Hewlett-Packard part numbers.

a. Instrument model number.
b. Instrument serial number.
c. Description of the part.
d. Function and location of the part.

6-6. HP PART NUMBER ORGANIZATION

6-7. Following is a general description of the HP part number system.

6-8. Component Parts and Materials

6-9. Generally, the prefix of HP part numbers identifies the type of device. Eight-digit part numbers are used, where the four-digit prefix identifies the type of component, part, or material and the four-digit suffix indicates the specific type. Following is a list of some of the more commonly used prefixes for component parts. The list includes HP manufactured parts and purchased parts.

Prefix	Component/Part/Material
0121-	Capacitors, Variable (mechanical)
0122-	Capacitors, Voltage Variable (semiconductor)
0140-	Capacitors, Fixed
0150-	Capacitors, Fixed (Non-Electrolytic)
0160-	Capacitors, Fixed
0180-	Capacitors. Fixed Electrolytic
0330-	Insulating Materials
0340-	Insulators. Formed
0370-	Knobs, Control
0380-	Spacers and Standoffs
0410-	Crystals
0470-	Adhesives
0490-	Relays
0510-	Fasteners
0674- thru 0778-	Resistors, Fixed (non wire wound)
0811- thru 0831-	Resistors (wire wound)
1200-	Sockets for components
1205-	Heat Sinks
1250-	Connectors (RF and related parts)
1251-	Connectors (non RF and related parts)
1410-	Bearings and Bushings
1420-	Batteries
1820-	Monolithic Digital Integrated Circuits
1826-	Monolithic Linear Integrated Circuits
1850-	Transistors, Germanium PNP
1851-	Transistors, Germanium NPN
1853-	Transistors, Silicon PNP
1854-	Transistors, Silicon NPN
1855-	Field-Effect-Transistors
1900- thru 1912-	Diodes
1920- thru 1952-	Vacuum Tubes
1990-	Semiconductor Photosensitive and Light-Emitting Diodes
3100- thru 3106-	Switches
8120-	Cables
9100-	Transformers, Coils, Chokes, Inductors, and Filters

6-10. For example, 1854-0037, 1854-0221, and 1851-0192 are all NPN transistors. The first two are silicon and the last is germanium.

6-11. General Usage Parts

6-12. The following list gives the prefixes for HP manufactured parts used in several instruments, e.g., side frames, feet, top and bottom covers, etc. these are eight-digit part numbers with the four-digit prefix identifying the type of parts as shown below:

Type of Part	Prefix
Sheet Metal	5000- to 5019-
Machined	5020- to 5039-
Molded	5040- to 5059-
Assemblies	5060- to 5079-
Components	5080- to 5099-

6-13. Specific Instrument Parts

6-14. These are HP manufactured parts for use in individual instruments or series of instruments. For these parts, the prefix indicates the instrument and the suffix indicates the type of part. For example, 05004-60003 is an assembly used in the 5004A. Following is a list of suffixes commonly used.

Type of Part	P/N Suffix
Sheet Metal	-00000 to -00499
Machined	-20000 to -20499
Molded	-40000 to -40499
Assembly	-60000 to -60499
Component	-80000 to -80299
Documentation	-90000 to -90249

6-15. Mechanical Parts

6-16. The major mechanical parts of the 5004A are shown in Figure 6-1, at the rear of this section. The parts are listed in the miscellaneous part section of the parts list under MP numbers.

SECTION VII
MANUAL CHANGES

7-1. INTRODUCTION

7-2. This section normally contains information for adapting this manual to instruments for which the content does not apply directly. Since this manual does apply directly to instruments having serial numbers listed on the title page, no change' information is given here. Refer to INSTRUMENTS COVERED BY MANUAL in Section I for additional important information about serial number coverage.

SECTION VIII
SERVICE

8-1. INTRODUCTION

8-2. This section provides safety considerations, logic symbols, troubleshooting procedures, block diagram and description, circuit theory, component location photos, and schematic diagram (service information).

8-3. SAFETY CONSIDERATIONS

8-4. Although this instrument has been designed in accordance with international safety standards, this manual contains information, cautions, and warnings which must be followed to ensure safe operation and to retain the instrument in safe condition (see Sections II, III, and V). Service and adjustments should be performed only by qualified service personnel.

WARNING

ANY INTERRUPTION OF THE PROTECTIVE (GROUNDING) CONDUCTOR (INSIDE OR OUTSIDE THE INSTRUMENT) OR DISCONNECTION OF THE PROTECTIVE EARTH TERMINAL IS LIKELY TO MAKE THE INSTRUMENT DANGEROUS. INTENTIONAL INTERRUPTION IS PROHIBITED.

8-5. Any adjustment, maintenance, and repair of the opened instrument under voltage should be avoided as much as possible and, when inevitable, should be carried out only by a skilled person who is aware of the hazard involved.

8-6. Capacitors inside the instrument may still be charged even if the instrument has been disconnected from its source of supply.

8-7. Make sure that only fuses with the required rated current and of the specified type (normal blow, time delay, etc.) are used for replacement. The use of repaired fuses and the short-circuiting of fuseholders must be avoided.

8-8. Whenever it is likely that this protection has been impaired, the instrument must be made inoperative and be secured against any unintended operation.

WARNING

THE SERVICE INFORMATION IS OFTEN USED WITH LINE POWER SUPPLIED AND PROTECTIVE COVERS REMOVED FROM THE INSTRUMENT. ENERGY AVAILABLE AT MANY POINTS MAY, IF CONTACTED, RESULT IN PERSONAL INJURY.

8-9. RECOMMENDED TEST EQUIPMENT

8-10. Test equipment and test equipment accessories required to maintain the 5004A are listed in Table 1-2. Equipment other than that listed may be used if it meets the listed critical specifications.

8-11. LOGIC SYMBOLS

8-12. Logic symbols used in this manual conform to the American National Standard ANSI Y32.14-1973 (IEE Std. 91-1973). This standard supersedes MIL-STD-806B. In the following paragraphs logic symbols are described.

8-13. Logic Concepts

8-14. The binary numbers 1 and 0 are used in pure logic where 1 represents true, yes, or active and 0 represents false, no, or inactive. These terms should not be confused with the physical quantity (e.g., voltage) that may be used to implement the logic, nor should the term "active" be confused with a level that turns a device on or off. A truth table for a relationship in logic shows (implicitly or explicit) all the combinations of true and false input conditions and the result (output). There are only two basic logic relationship, AND and OR. The following illustrations assume two inputs (A and B), but these can be generalized to apply to more than two inputs.

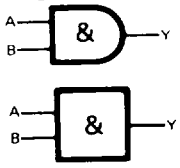
AND Y Is true if and only if A is true and B is true (or more generally, if all inputs are true).
Y=1 if and only if A=1 and B=1.
Y=A•B

OR Y is true if and only If A is true or B is true (or more generally, if one or more input(s) is (are) true).
Y=1 if and only if A=1 or B=1.
Y=A+B

TRUTH TABLE

A	B	Y
1	1	1
1	0	0
0	1	0
0	0	0

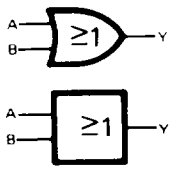
EQUIVALENT SYMBOLS



TRUTH TABLE

A	B	Y
1	1	1
1	0	1
0	1	1
0	0	0

EQUIVALENT SYMBOLS



8-15. Negation

8-16. In logic symbology, the presence of the negation indication symbol O provides for the representation of logic function inputs and outputs in terms independent of their physical values; the O-state of the input or output being the 1-state of the symbol referred to by the symbol description.

EXAMPLE 1

TRUTH TABLE

A	B	Z
1	1	0
1	0	1
0	1	1
0	0	1

EXAMPLE 2

TRUTH TABLE

A	B	Z
1	1	0
1	0	1
0	1	1
0	0	1

EXAMPLE 3

TRUTH TABLE

A	B	Z
1	1	0
1	0	0
0	1	0
0	0	1

EXAMPLE 4

TRUTH TABLE

A	B	Z
1	1	0
1	0	0
0	1	0
0	0	1

EXAMPLE 1 says that Z is not true if A is true and B is true or that Z is true if A and B are not both true. Z=AB or Z=AB. This is frequently referred to as NAND (for NOT AND).
EXAMPLE 2 says that Z is true if A is not true or if B is not true. Z = A + B. Note that this truth table is identical to that of Example 1. The logic equation is merely a De Morgan's transformation of the equations in Example 1. The symbols are equivalent.
EXAMPLE 3 Z =A + B or Z = A + B and,
EXAMPLE 4 Z = A • B, also share common truth table and are equivalent transformations of each other. The NOT OR form (Example 3) is frequently referred to as NOR.

NOTE

In this manual the logic negation symbol is NOT used.

8-17. Logic Implementation and Polarity Indication

8-18. Devices that can perform the basic logic functions, AND and OR, are called gates. Any device that can perform one of these functions can also be used to perform the other if the relationship of the input and output voltage levels to the logic variables 1 and 0 is redefined suitably.

8-19. In describing the operation of electronic logic devices, the symbol H is used to represent a "high level," which is a voltage within the more-positive (less-negative) of the two ranges of voltages used to represent the binary variables. L is used to represent a "low level," which is a voltage within the less-positive (more-negative) range.

8-20. A function table for a device shows (implicit or explicitly) all the combinations of input conditions and the resulting output conditions.

8-21. In graphic symbols, inputs or outputs that are active when at the high level are shown without polarity indication. The polarity indicator symbol  denotes that the active (one) state of an input or output *with respect to the symbol to which it is attached is the low level.*

NOTE

The polarity indicator symbol "  " is used in this manual.

EXAMPLE 5
Assume two devices having the following function tables.

DEVICE #1
FUNCTION TABLE

A	B	Y
H	H	H
H	L	L
L	H	L
L	L	L

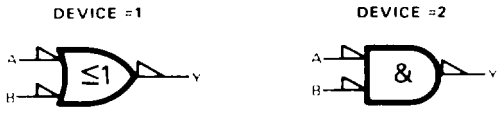
DEVICE #2
FUNCTION TABLE

A	B	Y
H	H	H
H	L	H
L	H	H
L	L	L

POSITIVE LOGIC
By assigning the relationships H=1, L=O at both input and output, Device #1 can perform the AND function and Device #2 can perform the OR function. Such a consistent assignment is referred to as positive logic. The corresponding logic symbols would be:

NEGATIVE LOGIC

Alternatively, by assigning the relationship H=O, L=1 at both input and output, Device #1 can perform the OR function and Device #2 can perform the AND function. Such a consistent assignment is referred to as negative logic. The corresponding logic symbols would be:

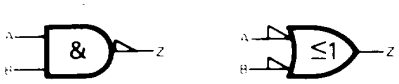


8-22. MIXED LOGIC. The use of the polarity indicator symbol (X) automatically invokes a mixed-logic convention. This is, positive logic is used at the input and outputs that do not have polarity indicators, negative logic is used at the inputs and outputs that have polarity indicators.

EXAMPLE 6
FUNCTION TABLE

A	B	Z
H	H	L
H	L	H
L	H	H
L	L	H

This may be shown either of two ways:

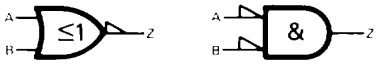


Note the equivalence of these symbols to example 1 and 2 and the fact that the function table is a positive-logic translation (H=1, L=O of the NAND truth table, and also note that the function table is the negative-logic translation (H=O, L=1) of the NOR truth table, given in Example 3.

EXAMPLE 7
FUNCTION TABLE

A	B	Z
H	H	L
H	L	L
L	H	L
L	L	H

This may be shown either of two ways:



Note the equivalence of these symbols to examples 3 and 4 and the fact that the function table is a positive-logic translation (H=l, L=O) of the NOR truth table, and also note that the function table is the negative-logic translation (H=O, L=l) of the NAND truth table, given in Example 1.

8-23. It should be noted that one can easily convert from the symbology of positive-logic merely by substituting a polarity indicator (▷) for each negative indicator (○) while leaving the distinctive shapes alone. To convert from the symbology of negative logic, a polarity indicator (▷) is substituted for each negation indicator (o) and the OR shape is substituted for the AND shape or vice versa.

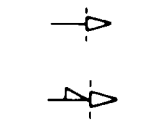
8-24. It was shown that any device that can perform OR logic can also perform AND Igoic and vice versa. De Morgan's transformation is illustrated in Examples 1 through 7. The rules of the transformation are:

1. At each input or output having a negation (○) or polarity (▷) indicator, delete the indicator.
2. At each input or output not having an indicator, add a negation (○) or polarity (▷) indicator.
3. Substitute the AND symbol (D) for the OR symbol (D) or vice versa. These steps do not alter the assumed convention; positive-logic stays positive, negative-logic stays negative, and mixed-logic stays mixed.

8-25. The choice of symbol may be influenced by these considerations: (1)The operation being performed may best be understood as AND or OR. (2) In a function more complex than a basic gate, the inputs will usually be considered as inherently active high or active low (e.g., the J and K inputs of a J-K flip-flop are active high and active low, respectively). (3) In a chain of logic, understanding and the writing of logic equations are often facilitated if active-low or negated outputs feed into active-low or negated inputs.

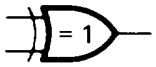
8-26. Other Symbols

8-27. More symbols are required to depict complex logic diagrams. Some of the other symbols are as follows:

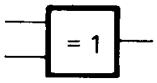


Dynamic input activated by transition from a low level to a high level. The opposite transition has no effect at the output.

Dynamic input activated by transition from a high level to a low level. The opposite transition has no effect at the output.

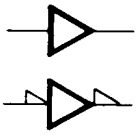


Exclusive OR function. The output will assume its indicated active level if and only if one and only one of the two inputs assumes its indicated active level.



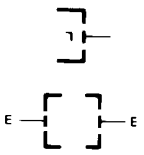
Inverting function. The output is low if the input is high and it is high if the input is low. The two symbols shown are equivalent.

Noninverting function. The output is high if the input is high and it is low if the input is low. The two symbols shown are equivalent.



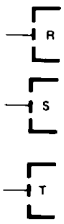
OUTPUT DELAY. The output signal is effective when the input signal returns to its opposite state.

EXTENDER. Indicates when a logic function increases (extends) the number of inputs to another logic function.



FLIP-FLOP. A binary sequential element with two stable states: a set (1) state and a reset (0) state. Outputs are shown in the 1 state when the flip-flop is set. In the reset state the outputs will be opposite to the set state.

RESET. A 1 input will reset the flip-flop. A return to 0 will cause no further effect.



SET. A 1 input will set the flip-flop. A return to 0 will cause no further action.

TOGGLE. A 1 input will cause the flip-flop to change state. A return to 0 will cause no further action.

J INPUT. Similar to the S input except if both J and K (see below) are at 1, the flip-flop changes state.

K INPUT. Similar to the R input (see above).

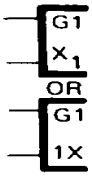
D INPUT (Data). Always dependent on another input (usually C). When the C and D inputs are at 1, the flip-flop will be set. When the C Is 1 and the D is O, the flip-flop will reset.

Address symbol has multiplexing relationship at inputs and demultiplexing relationship at outputs.

8-28. Dependency Notation "C" "G" "V" "F"

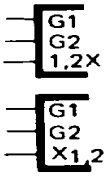
8-29. Dependency Notation is a way to simplify symbols for complex IC elements by defining the existence of an AND relationship between inputs, or by the AND conditioning of an output by an input without actually showing all the elements and interconnections involved. The following examples use the letter "C" for control and "G" for gate. The dependent input is labeled with a number that is either prefixed (e.g., 1X) or subscripted (e.g., X1). They both mean the same thing. The letter V is used to indicate an OR relationship between inputs or between inputs and outputs with this letter (V). The letter F indicates a connect-disconnect relationship. If the F (free dependency) inputs or outputs are active (1) the other usual normal conditions apply. If one or more of the F inputs are inactive (0), the related F output is disconnected from its normal output condition (it floats).

The input that controls or gates other inputs is labeled with a "C" or a "G",
followed by an identifying number. The controlled or gated input or output Is
labeled with the same number. In this example, "1" is controlled by "G1."



When the controlled or gated input or output already has a functional label (X
is used here), that label will be prefixed or subscripted by the Identifying number.

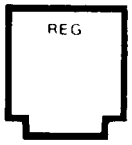
If a particular device has only one gating or control input then the identifying
number may be eliminated and the relationship shown with a subscript.



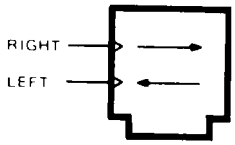
If the input or output is affected by more than one gate or control input, then the
identifying numbers of each gate or control input will appear in the prefix or
subscript, separated by commas. In this example "X" is controlled by "G1"
and "G2."

8-30. Control Blocks

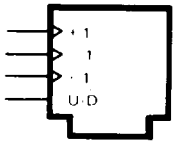
8-31. A class of symbols for complex logic are called control blocks. Control blocks are used to show where common control signals are applied to a group of functionally separate units. Examples of types of control blocks follow.



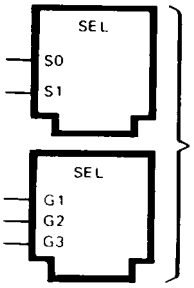
Register control block. This symbol is used with an associated array of flip-flop symbols to provide a point of placement for common function lines, such as a common clear.



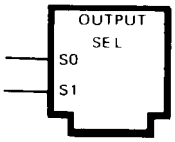
Shift register control block. These symbols are used with any array of flip-flop symbols to form a shift register. An active transition at the inputs causes left or right shifting as indicated.



Counter control block. The symbol is used with an array of flip-flops or other circuits serving as a binary or decade counter. An active transition at the +1 or -1 input causes the counter to increment one count upward or downward, respectively. An active transition at the ± 1 input causes the counter to increment one count upward or downward depending on the input at an up/down control.



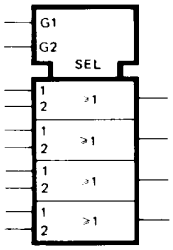
Selector control block. These symbols are used with an array of OR symbols to provide a point of placement for selection (S) or gating (G) lines. The selection lines enable the input designated 0, 1, ...n of each OR function by means of a binary code where SO is the least-significant digit. If the 1 level of these lines is low, polarity indicators ( ) will be used. The gating lines have an AND relation with the respective input of each OR function: G1 with the inputs numbered 1, G2 with the input numbered 2, and so forth. If the enabling levels of these lines is low, polarity indicators ( ) will be used.



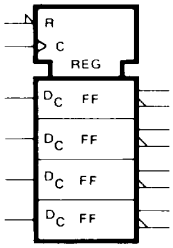
Output selector control block. This symbol is used with a block symbol having multiple outputs to form a decoder. The selection lines enable the output designated 0, 1, ...n of each block by means of a binary code where SO is the least-significant digit. If the 1 level of these lines is low, polarity indicators ( ) will be used.

8-32. Complex Logic Devices

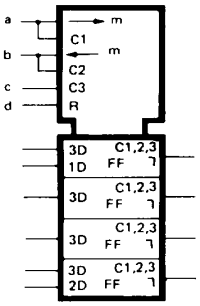
8-33. Logic elements can be combined to produce very complex devices that can perform more difficult functions. A control block symbol can be used bo simplify understanding of many complex devices. Several examples of complex devices are given here.



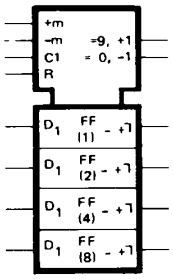
Selector Control Block used to simplify AND portion of a quad AND-OR select gate. When G1 is high, the data presented at the "1" inputs will be gated through. When G2 is high, the data presented at the "2" inputs will be gated through.



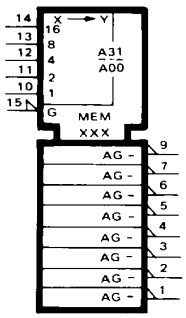
Register control block used to Illustrate a quad D-type latch. There is a common active-low reset (R), and a common edge-triggered control input (C). Since there is only one dependency relationship, the controlling input is not numbered and the controlled functions (D) are subscripted with a C.



Shift Register Control Block used to show common Inputs to a bidirectional shift register. Notice that "→m" means shift the contents to the right or down by "m" units. And "←m" means shift the contents to the left or up by "m" units. Note: If m=l, it may be omitted. Inputs "a" and "b" are each single IC pins that have two functions. Input "a" enables one of the inputs to the top D-type flip-flop (1D), and also shifts the register contents down one unit. Input "b" enables one of the inputs to the bottom flip-flop (2D), and also shifts the register contents up one unit. Input "c" loads all four flip-flops in parallel (3D). Input "d" is a common reset. The output delay Indicator is used because these are master-slave flip-flops.



Counter Control Block used to show common inputs to a Presettable Decade Up/Down Counter. Notice that "+m" means count up (increment the count) by "m;" "-m" means count down by "m." Note: if m=l, it may be omitted. Since the D-type flip-flops are master-slave, the output delay indicator is used. The "=9, t1" and "=9, -1" notation defines when the carry and borrow outputs are generated. They also define it, as a decade counter; a binary counter would have carry indicated with "=15, +1." Flip-flop weighting is indicated in parenthesis.



Read Only Memory (ROM) with 32 addresses. Address selection is determined by the five upper inputs which are decoded into 32 possible addresses (A00 through A31) corresponding to the weighting modifiers at the inputs. Input modifier G (pin 15) gates the outputs. Stored data will be read from the selected memory address if G is active (low). The output data pins (1-7 and 9) are active low. The "-" indicator shows the 8 outputs are capable of supplying low outputs only. A high output is usually supplied by a resistor to a "high" voltage.

8-34. TROUBLESHOOTING (FAILURE ANALYSIS)

8-35. Information to help locate a fault or trouble in the 5004A is given in the following material.

8-36. Several troubleshooting aids are permanently built-in the 5004A. The SELF-TEST front panel switch is one. The main assembly (motherboard) NORMAL SERVICE switch is another. The front panel GATE lamp is another. The four-front panel seven-segment digit displays are another. The front panel UNSTABLE SIGNATURE is another.

8-37. The front panel SELF-TEST switch operation is described in Section III of this manual.

8-38. Troubleshooting Flowchart

8-39. *Figure 8-1*, the troubleshooting flowchart may be used to locate a faulty component. A suggested sequence for troubleshooting is:

a. Perform the Operator's Self-Test (see in Section II1).
b. If the 5004A does not pass the Operators Self-test, perform the steps given in the troubleshooting flowchart *(Figure 8-1*).

8-40. Major Test Point Signatures

8-41. *Table 8-1* lists the signatures for the major test points.

8-42.Troubleshooting Signatures with SELF-TEST and NORMAL/SERVICE Switches

8-43. *Table 8-2* is a listing of signatures taken from a correctly operating 5004A with a second correctly operating 5004A. These signatures may be used to locate the cause of a malfunction in a 5004A Signature Analyzer. To take most of the signatures listed requires that the top cover of the 5004A be removed. Refer to the disassembly procedures before attempting to remove the top cover.

WARNING

IF THE 5004A TOP COVER IS REMOVED, DANGEROUS VOLTAGES ARE EXPOSED. ONLY QUALIFIED ELECTRONIC SERVICE TECHNICIANS SHOULD ATTEMPT TO SERVICE THE 5004A WITH COVERS REMOVED.

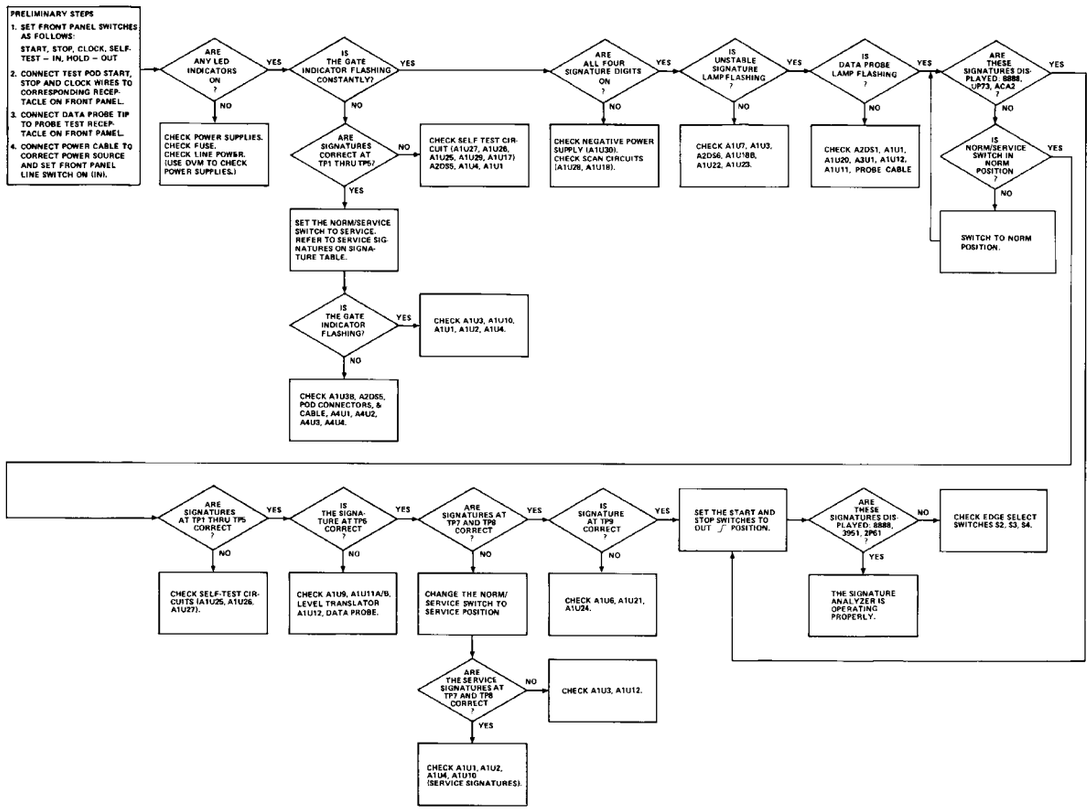


Figure 8-1. Troubleshooting Flowchart

Table 8-1. Troubleshooting Signatures Major Test Points

Test Point*	Location	Signature	
		NORMAL	SERVICE

Table 8-2. SELF-TEST and NORMAL/SERVICE Signatures

8-44. DISASSEMBLY AND REASSEMBLY PROCEDURES

8-45. To remove the 5004A covers, use the following procedure:

WARNING

WHEN THE COVERS ARE REMOVED FROM THE 5004A, LINE VOLTAGES WHICH ARE DANGEROUS AND MAY CAUSE SERIOUS INJURY WHEN TOUCHED. DO NOT REMOVE THE COVERS UNLESS IT IS NECESSARY.

1. Disconnect the power cable from the rear panel of the 5004A.
2. Turn the 5004A over with the cable case down. Four screws are exposed.
3. On the back panel of the 5004A loosen the two screws at the ends of the heat sink three or four turns (*see Figure 8-2)*

NOTE

DO NOT loosen the transistor retaining screws (see Figure 8-2).

4. Remove the four screws near the four corners of the cabinet bottom.
5. Hold the top and bottom covers together and turn the 5004A right side up.
6. Carefully lift the top cover off.

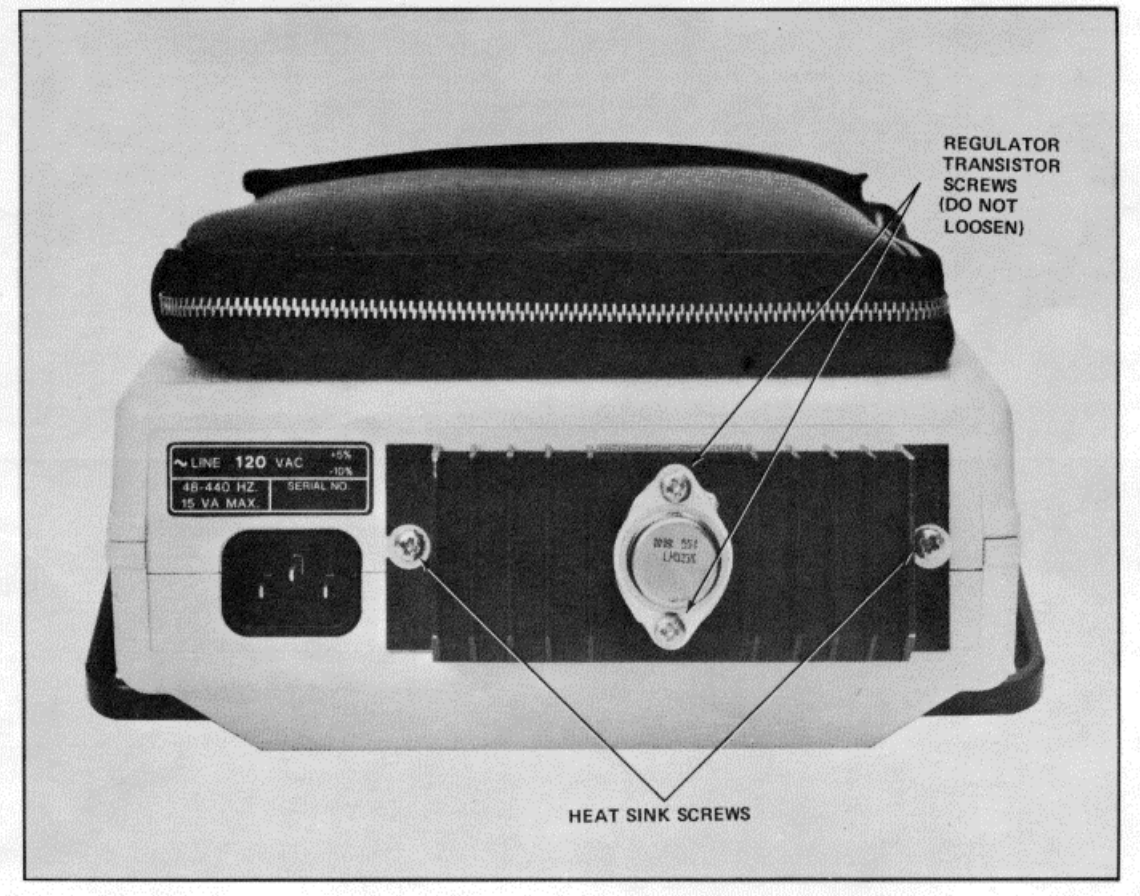

Figure 8-2. Heat Sink Screws Locations

NOTE

If the heat sink on the rear panel is still holding the cover together, loosen the sink screws a few more turns.

WARNING

BE CAREFUL OF EXPOSED LINE VOLTAGE POINTS.

7. If necessary the bottom cover can be removed.
8. To reassemble the 5004A reverse the preceding steps.

8-46. Data Probe Disassembly and Reassembly

8-47. To disassemble the data probe, use the following procedure.

1. Disconnect the power cable from the 5004A. Remove the GND wire from the probe.

NOTE

Figure 6-1 **shows the mechanical parts of the probe. Figure 8-7 shows the probe with its covers removed.**

2. Remove the probe tip by turning it with fingers counterclockwise.

NOTE

The red window has a projecting stud that fits in the body of the probe near the GND pin (off-set slightly).

3. Carefully pull the red window off the probe tip.
4. Slide the two half covers carefully off the probe printed circuit board.

NOTE

The two body shells interlock to cover the printed circuit board.

5. Reverse the preceding steps to reassemble the data probe.

8-48. Gating Signals Pod Disassembly and Reassembly

8-49. To disassemble the gating signals pod, use the following procedure.

1. Disconnect the power cable from the 5004A.

NOTE

Figure 6-1 **shows the mechanical parts of the pod.** ***Figure 8-7*** **shows the probe with its covers removed.**

2. Squeeze the ends of the pod test leads connector and pull the connector off the pod.
3. Remove the four screws from the bottom cover of the pod, and carefully remove the top cover. The bottom cover can also be removed if necessary.

NOTE

The pod cable has a strain protector which fits in a slot in the covers of the pod.

4. Reverse the above procedure to reassemble the pod.

8-50. BLOCK DIAGRAM DESCRIPTION

8-51. In the following paragraphs a description of the 5004A Signature Analyzer is given to match Figure 8-3 the block diagram in this section. A more detailed description of the 5004A is given in the paragraphs following the heading: CIRCUIT THEORY (PRINCIPLES OF OPERATION) (SCHEMATIC DIAGRAM DESCRIPTION).

8-52. A 5004A Signature Analyzer requires four input signals: START, STOP, CLOCK, and DATA. START, CLOCK, and STOP inputs are applied to the 5004A through the GATING SIGNALS POD.

8-53. Data Signal Path. DATA input is through the DATA PROBE. Signals applied to the DATA PROBE are connected to dual paths which trigger at high and low voltage levels respectively. The output of these level detectors is at ECL level and drive a pair of ECL to TTL converters on the main assembly. A logic level detector across the ECL converters provides the drive for the logic level indicator at the data probe tip. The outputs of the ECL converters is translated from a possible three levels (high, bad (middle), and low) to standard high or low levels at the selected clock. (When a bad level appears atthe input of the data probe, it is converted to whatever the previous data level was: (either high or low.) Data from the 3-to-2 level converter is applied to the pseudo-random word generator with corresponding gate and clock signals. For each different clocked data stream (series of bits) bracketed by a start and stop signal, a different word (signature) is generated by the word generator. Each signature is sent to the display latches which supply them to the decoder-driver and the signature comparator. The decoder-driver translates the signature to a special-form hexadecimal number which is applied to the display. Each succeeding signature is compared with the preceding signature in the signature comparator which will activate the UNSTABLE SIGNATURE lamp if two succeeding signatures are different. The RESET function for the entire 5004A is part of the DATA probe. RESET is activated by a switch (labeled RESET) on the DATA probe.

8-54. Clock, Start, and Stop Signal Paths

8-55. External CLOCK, START, and STOP signals are applied to the 5004A through the gating signals pod. Input CLOCK, START, and STOP signals are eamplified, and connected to operator-controlled edge-select circuits. After edge-selection the CLOCK, START, and STOP signals are combined to form a gating (gate) control signal. (The external CLOCK signal is also buffered and used to time other sections of the 5004A.) The gate signal is presented on the front panel with a GATE indicator lamp. The gate signal is for on-off (start-stop) control of the word generator.

8-56. Scan/Test Oscillator (Internal Clock)

8-57. A .6 kilohertz signals is generated in the 5004A for display scan and test use. The scan signal controls switching the displays on and off (fast enough to be not noticeable) to lower power consumption and reduce the size of drive circuit components. In the SELF-TEST and NORMAL/SERVICE (troubleshooting) modes the internal test signal is used as a substitute for the external clock normally applied to the gating signals pod.

8-58. Self-Test

8-57. Part of the 5004A is a circuit used only for self-test of the signature analyzer. The self-test function is controlled by a front panel switch. In the self-test mode special signatures are generated using the internal test signal frequency divider output (ROM). If there is a defect in the 5004A the self-test signature will not be correct.

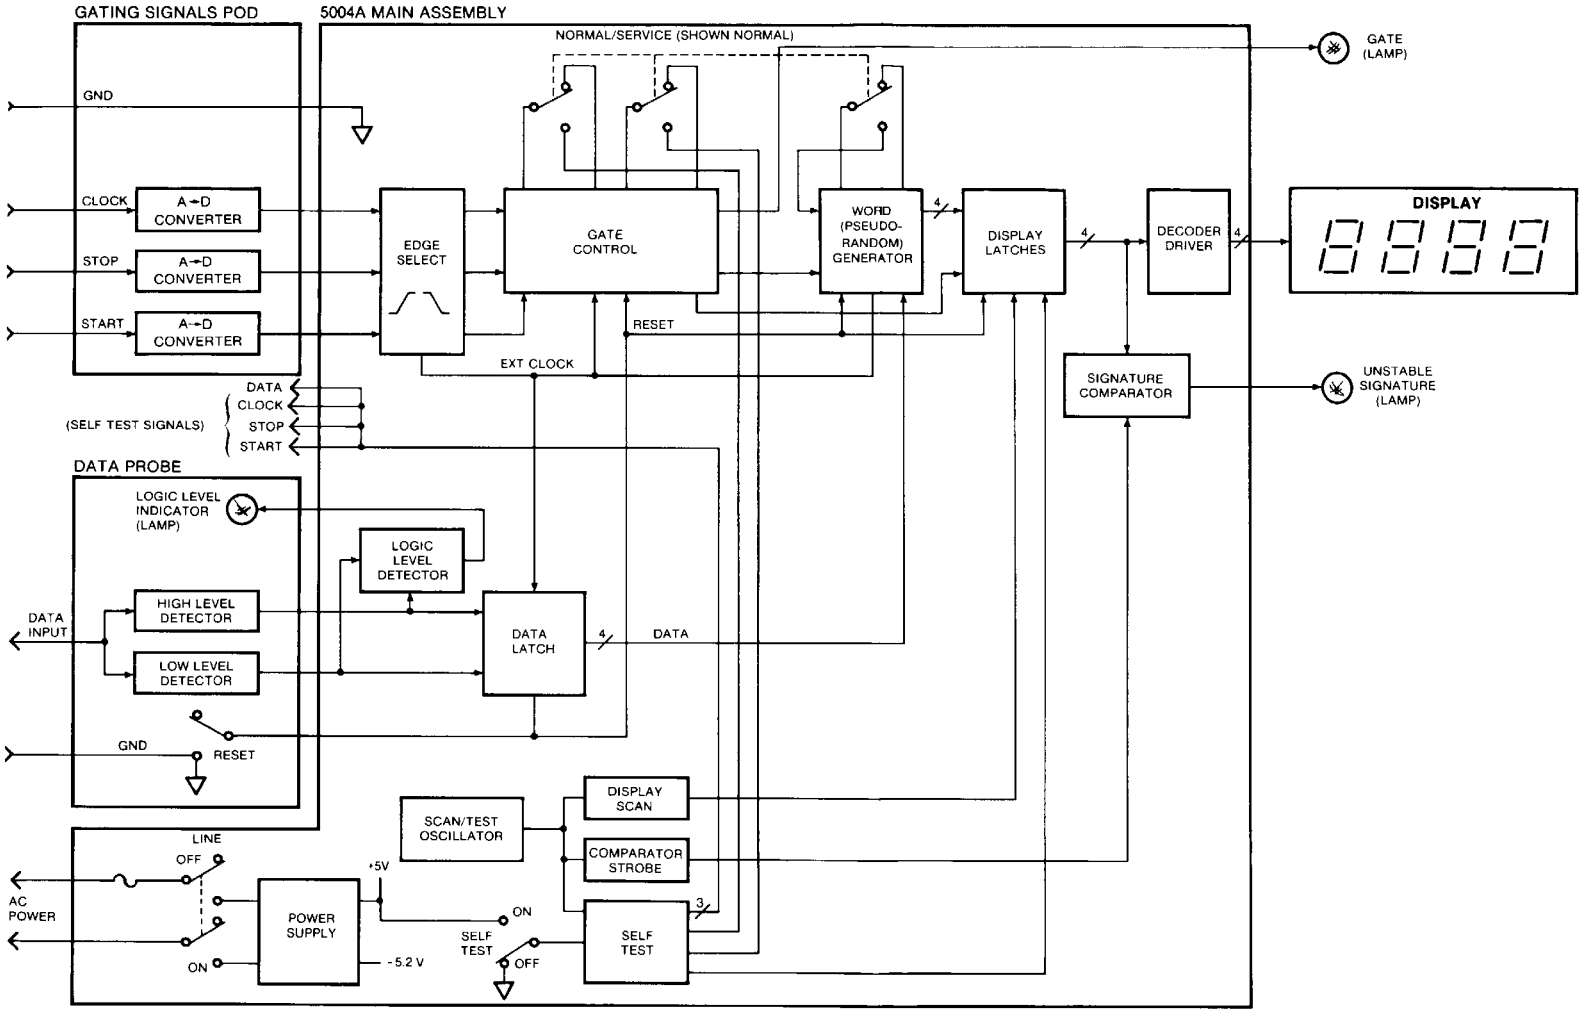

Figure 8-3.
5004A CIRCUIT BLOCK DIAGRAM

8-60. Display Scan and Comparator Strobe

8-61. The clock signal is used to time both the display scan and signature compactor strobe circuits. The digit display lamps are enabled less than full-time to conserve power.

NOTE

The NORMAL/SERVICE switch is separate but related to the front panel SELF-TEST switch.

8-62. Service (Troubleshooting) Mode

8-63. On the main assembly of the 5004A a two-position switch, labeled NORMAL/SERVICE, can be used during fault locating (troubleshooting) procedures if the 5004A is not operating correctly.

8-64. Power Supply

8-65. Alternating current line supply (mains) voltage is converted to the two positive and negative regulated direct current voltages required in the 5004A by the power supply circuit.

8-66. CIRCUIT THEORY (PRINCIPLES OF OPERATION)

8-67. The following paragraphs give the circuit theory (principles of operation) for the 5004A Signature Analyzer to explain the schematic diagram. A previous section describes the 5004A at the block diagram level. This BLOCK DIAGRAM DESCRIPTION should be studied and learned before the following paragraphs are studied.

8-68. Purpose of 5004A

8-69. The 5004A Signature Analyzer is designed to be used in testing the correctness of operation of certain complex digital logic electronic instruments or systems. A technique of testing called signature analysis is used with the 5004A and compatible instruments. Refer to the paragraph titled Signature Analysis in Section I for an explanation of signature analysis.

8-70. Schematic Diagram

8-71. The 5004A schematic diagram is presented with the four inputs on the left side, and the flow of signals is generally from the left to the right side where the output indicators are presented. Outputs are four digits (seven-segment LED's) and two single-LED function/condition indicators. Refer to the schematic diagram notes for an explanation of the schematic symbol system used. The ac line power input and dual-voltage (regulated) power supply are on the lower left side of the schematic.

8-72. Gating Signals Pod

8-73. The gating signals pod is the input for the CLOCK, START, and STOP signals to the 5004A. Requirements for these signals are given in Section I. A voltage regulator, U4, for -5.2V on the pod board reduces power dissipation in the main assembly. Amplifier, U1, is used as a voltage follower to provide the 1.4-volt reference level for the three input amplifier-converters. All three input signals are each applied to three separate identical circuits. The input amplifier-converters produce high-speed complementary-output ECL-level signals for the main assembly.

8-74. Edge Selection

8-75. The three ECL-level pulse signals from the pod (START, STOP, and CLOCK) are applied separately to three front-panel switches which may be used to select the polarity of any input signal. Changing the polarity of a signal effectively selects the opposite edge of the input signal as the control for that channel.

8-76. ECL-to-TTL Level Converters

8-77. After the edge select switches the gating signals are applied to four separate ECL-to-TTL level converters. (The CLOCK signal is applied to two separate converters, U12A and B, for two separate paths.) The outputs of the START and STOP level converters are applied to latches which are controlled by the CLOCK signal. The latches outputs are applied to the gate control circuit.

8-78. Gate Control

8-79. The input START and STOP signals are processed in the gate control circuit to produce a definite time window during which data is received by the word generator (described later). Operation of the gate control circuit is described in the following paragraph.

8-80. State Diagram

8-81. Figure 8-4 is a state diagram of the functioning of the gate control circuits. NOTE: Positive-true logic is used. The INITIAL state normally occurs: when the 5004A has power switched on, or when the data probe RESET switch is pressed, or when a STOP and START pulse are received in RUN mode. In the INITIAL state, if START is 0 the state will change to ARMED. In the ARMED state the 5004A is ready to receive a START pulse and proceed to either RUN mode. (Note that if a STOP pulse is received, the state will be intermediate RUN; and to progress to full RUN, STOP must be 0.) From full RUN the state will return to INITIAL if START and STOP pulses are received. If START remains at 0 and a STOP pulse is received, the state returns to ARMED. The HOLD state occurs when the HOLD switch is in and a STOP pulse is received in the full RUN mode. In the HOLD state, the data probe RESET switch must be pressed to return to the INITIAL state. All modes except HOLD have no-change conditions. For example in the ARMED state if the START line remains at 0, the 5004A will not change to RUN. With proper START, STOP, and CLOCK signals the gate control proceeds through the states repetitively. The gate control circuit output starts and stops the word generator, and provides the on-off control of the GATE lamp to show when the START and STOP signals are received and implemented.

8-82. Data Signal Flow

8-83. In normal operation, data signals from the unit being tested are applied to the 5004A high-speed data probe. The data probe (A3) discriminates whether the input TTL level is high or low or bad (middle level). If the input level is high it is detected by U1A, if it is low it is detected by U1B. The input signal is converted to a pair of two-line differential (complementary) ECL signals and sent to the main assembly. At the input to the main assembly the data signal is converted from a pair of two-line (differential) ECL signals to a pair of signals at TTL level.

8-84. The pair of data signals at pins 6 and 12 of Ull (A and B) are applied to the data latch, U9. If the data input signal is a high level or a low level it is clocked out of the data latch on pin 5. If it is a bad (middle) level signal the previous level signal is clocked out of the data latch. (A bad level appears as tow lows at the U9J and K inputs.)

8-85. In the main assembly the data TTL signals at the junction of R37 and R38 are applied to U20, a logic level detector. The detector responds to the combined TTL level (or pulses) of the input signal, and it controls the indication of the logic level indicator lamp, DS1, in the data probe. The two TTL data signals are applied to the data latch, J9. Data from U9(5) is applied to U6(5), an "exclusive-OR" gate. This is the input of the pseudo-random word generator.

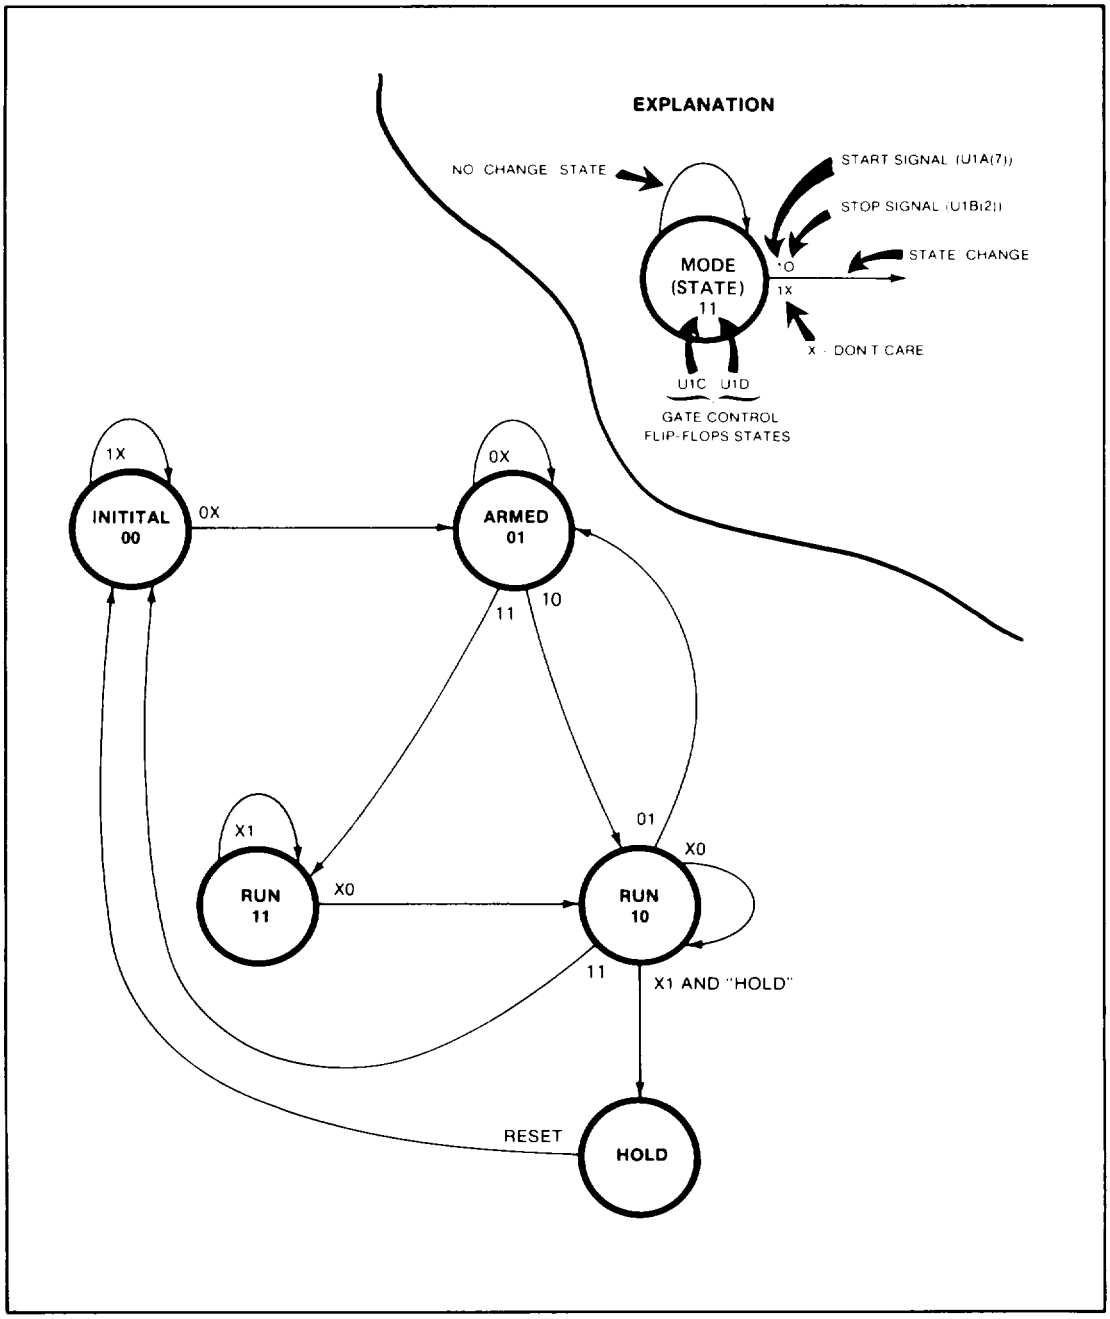

Figure 8-4. Gate Control State Diagram

8-86. Pseudo-Random Word Generator (Data Signal Path Continued)

8-87. The pseudo-random word generator is the central principle of the signature analysis method. A shift register with some outputs fed back is used to generate a pseudo-random word (signature) output. Input data goes through U6 to shift register U21. From U21(13) the data goes to U24(1 and 2) input. One output from U21 (pin 12) and three outputs from U24 (pins 3, 6, and 13) are fed back to the U6 inputs to combine with the input data and modify the resultant output of the shift registers. The outputs of the two shift registers (U24 and U21) are the unique "signatures."

8-88. Display Control (Data Signal Path Continued)

8-89. The 16-line signature output of the word generator is applied to the inputs of registers U15, U16, U13, and U14 which drive U19 a memory used as a character decoder. The output of U19 is applied to the four LED seven-segment digits on the display assembly.

8-90. Signature Comparator (UNSTABLE Signature Lamp)

8-91. As each signature is applied to the character decoder, U19, it is also stored in memory U22. When the next signature is received it is compared with the previous signature in U23. If the two signatures are different, U23 outputs a pulse to U7A which is sent to pulse-on the UNSTABLE SIGNATURE lamp on the display assembly, A2. If succeeding signals are identical, U23 does not send a pulse to the lamp. The comparator receives a low-frequency strobe signal from U18B which controls the timing of a store and compare cycle.

8-92. Scan/Test Oscillator

8-93. U28 is a low-frequency (.6 Khz) square wave oscillator. The output of U28 is used for the test circuit and to scan the displays.

8-94. Display Scan

8-95. The front-panel-switched self-test circuit includes U27, U25, U29, and U17. The four-bit counters, U27 and U25 are cycled by a signal from the self-test oscillator, U28, through U26. Outputs of U27 and U26 address memory U29 which supplies START and STOP signals in the self-test mode. All possible states of the gate control circuit are exercised in each self-test cycle to check proper operation. Self-test signals are applied to the inputs of the 5004A to allow all circuits to be tested. Part of the test besides specific signatures is to apply trash to U17 which will exercise all seven segments of each display digit.

8-98. NORMAL/SERVICE Test Switch

8-99. The NORMAL/SERVICE test switch on the main assembly allows all feedback paths in the 5004A to be opened for complete signature analysis testing, with a second 5004A Signature Analyzer. (Refer to the troubleshooting procedures in this section.)

8-100. INPUT SIGNAL TIMING

8-101. Figure 8-5 shows the timing relationship between the input, CLOCK, START, DATA, and STOP signals. The diagram shows that the START signal must transition from low to high before the gate will open, and data in the middle level is accepted as the preceding condition.

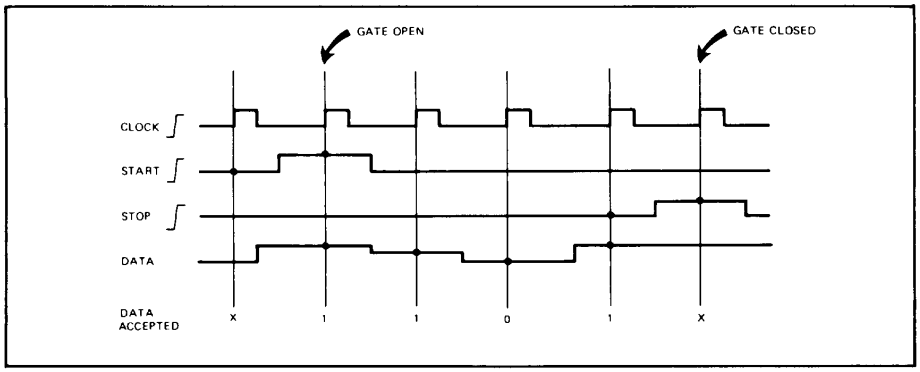

Figure 8-5. Input Signals Timing

SCHEMATIC DIAGRAM NOTES

Resistance in ohms, capacitance in picofarads, inductance in millihenries unless otherwise noted.

* Asterisk denotes a factory-selected value. Value shown in typical. Part may be omitted.

Tool-aided adjustment. ○ Manual control.

Encloses front-panel caption.

Encloses rear-panel caption.

Encloses interior or printed-circuit board caption.

Circuit assembly borderline.

Other assembly borderline. Also used to indicate mechanical interconnection (ganging).

CW Wiper moves toward CW with clockwise rotation of control (as viewed from shaft or knob).

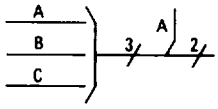
(1) Numbered Test Point. Measurement aid provided

(A) Lettered Test Point. No measurement aid provided.

A direct conducting connection to the earth, or a conducting connection to a structure that has a similar function (e.g., the frame of an air, sea, or land vehicle).

A conducting connection to a chassis or frame.

Common connections. All like-designated points are connected.



Indicates multiple paths represented by only one line. Letters or names identify individual paths. Numbers indicate number of paths represented by the line.

Integrated Circuit Power Terminals

Unless noted otherwise*, +5 volts is applied to each integrated circuit as given below:

14-Pin Units	Power	16-Pin Units
Pin 14	+5V	Pin 16
Pin 7	Return	Pin 8
Exceptions U25, U26, U27		
Pin 14	+5V	
Pin 10	Return	

NOTE

Several integrated circuits use the -5.2V power. The -5.2V pins are shown on the schematic diagram.

APPENDIX B

COMPONENTS OF END ITEM LIST

Section I. INTRODUCTION

B-1. Scope

This appendix lists integral components of and basic issue items for the TS-3791/U to help you inventory items required for safe and efficient operation.

B-2. General

This Components of End Item List is divided into the following sections:

a. Section II. Integral Components of the End Item. Not applicable. These items, when assembled, comprise the TS-3791/U and must accompany it whenever it is transferred or turned in.

The illustrations will help you identify these items.

b. Section III. Basic Issue Items. Not applicable. These are the minimum essential items required to place the TS-3791/U in operation, to operate it, and to perform emergency repairs. Although shipped separately packed they must accompany the TS-3791/U during operation and whenever it is transferred between accountable officers. The illustrations will assist you with hard-to-identify items. This manual is your authority to requisition replacement BII, base don TOE/MTOE authorization of the end item.

B-3. Explanation of Columns

a. Illustration. This column is divided as follows:

(1) Figure number. Indicates the figure number of the illustration on which the item is shown.

(2) Item number. The number used to identify item called out in the illustration.

b. National Stock Number. Indicates the National stock number assigned to the item and which will be used for requisitioning.

c. Description. Indicates the Federal item name and, if required, a minimum description to identify the item. The part number indicates the primary number used by the manufacturer, which controls the design and characteristics of the item by means of its engineering drawings, specifications, standards, and inspection requirements to identify an item or range of items. Following the part number, the Federal Supply Code for Manufacturers (FSCM) is shown in parentheses.

d. Location. The physical location of each item listed is given in this column. The lists are designed to inventory all items in one area of the major item before moving on to an adjacent area.

e. Usable on Code. Not applicable.

f. Quantity Required (Qty Reqd). This column lists the quantity of each item required for a complete major item.

g. Quantity. This column is left blank for use during an inventory. Under the Rcvd column, list the quantity you actually receive on your major item. The Date columns are for your use when you inventory the major item.

(Next printed page is B-2.)

APPENDIX D

MAINTENANCE ALLOCATION

Section I. INTRODUCTION

D-1. General

This appendix provides a summary of the maintenance operations for the TS-3791/U. It authorizes categories of maintenance for specific maintenance functions on repairable items and components and the tools and equipment required to perform each function. This appendix may be used as an aid in planning maintenance operations.

D-2. Maintenance Function

Maintenance functions will be limited to and defined as follows:

a. Inspect. To determine the serviceability of an item by comparing its physical, mechanical, and/ or electrical characteristics with established standards through examination.

b. Test. To verify serviceability and to detect incipient failure by measuring the mechanical or electrical characteristics of an item and comparing those characteristics with prescribed standards.

c. Service. Operations required periodically to keep an item in proper operating conditions, i.e., to clean (decontaminate), to preserve, to drain, to paint, or to replenish fuel, lubricants, hydraulic fluids, or compressed air supplies.

d. Adjust. To maintain, within prescribed limits, by bringing into proper or exact position, or by setting the operating characteristics to the specified parameters.

e. Align. To adjust specified variable elements of an item to bring about optimum or desired performance.

f. Calibrate. To determine and cause corrections to be made or to be adjusted on instruments or test measuring and diagnostic equipments used in precision measurement. Consists of comparisons of two instruments, one of which is a certified standard of known accuracy, to detect and adjust any discrepancy in the accuracy of the instrument being compared.

g. Install. The act of emplacing, seating, or fixing into position an item, part, module (component or assembly) in a manner to allow the proper functioning of the equipment or system.

h. Replace. The act of substituting a serviceable like type part, subassembly, or module (component or assembly) for an unserviceable counterpart.

i. Repair. The application of maintenance services (inspect, test, service, adjust, align, calibrate, replace) or other maintenance actions (welding, grinding, riveting, straightening, facing, remachining, or resurfacing) to restore serviceability to an item by correcting specific damage, fault, malfunction, or failure in a part, subassembly, module (component or assembly), end item, or system.

j. Overhaul. That maintenance effort (service/ action) necessary to restore an item to a completely serviceable/operational condition as prescribed by maintenance standards (i.e., DMWR) in appropriate technical publications. Overhaul is normally the highest degree of maintenance performed by the Army. Overhaul does not normally return an item to like new condition.

k. Rebuild. Consists of those services actions necessary for the restoration of unserviceable equipment to a like new condition in accordance with original manufacturing standards. Rebuild is the highest degree of materiel maintenance applied to Army equipment. The rebuild operation includes the act of returning to zero those age measurements (hours, miles, etc.) considered in classifying Army equipments/components.

D-3. Column Entries

a. Column 1, Group Number. Column 1 lists group numbers, the purpose of which is to identify components, assemblies, subassemblies, and modules with the next higher assembly.

b. Column 2, Component,/Assembly. Column 2 contains the noun names of components, assemblies, subassemblies, and modules for which maintenance is authorized.

c. Column 3, Maintenance Functions. Column 3 lists the functions to be performed on the item listed in column 2. When items are listed without maintenance functions, it is solely for purpose of having the group numbers in the MAC and RPSTL coincide.

d. Column 4, Maintenance Category. Column 4 specifies, by the listing of a "worktime" figure in the appropriate subcolumn(s), the lowest level of maintenance authorized to perform the function listed in column 3. This figure represents the active time required to perform that maintenance function at the indicated category of maintenance.

If the number or complexity of the tasks within the listed maintenance function vary at different maintenance categories, appropriate "worktime" figures will be shown for each category. The number of task-hours specified by the "worktime" figure represents the average time required to restore an item (assembly, subassembly, component, module, end item or system) to a serviceable condition under typical field operating conditions.

This time includes preparation time, troubleshooting time, and quality assurance/quality control time in addition to the time required to perform the specific tasks identified for the maintenance functions authorized in the maintenance allocation chart. Subcolumns of column 4 are as follows:

C - Operator/Crew
O - Organizational
F - Direct Support
H - General Support
D - Depot

e. Column 5, Tools and Equipment. Column 5 specifies by code, those common tool sets (not individual tools) and special tools, test, and support equipment required to perform the designated function.

f. Column 6, Remarks. Column 6 contains an alphabetic code which leads to the remark in section II, Remarks, which is pertinent to the item opposite the particular code.

D-4. Tool and Test Equipment Requirement (sect III)

a. Tool or Test Equipment Reference Code. The numbers in this column coincide with the numbers used in the tools and equipment column of the MAC. The numbers indicate the applicable tool or test equipment for the maintenance functions.

b. Maintenance Category. The codes in this column indicate the maintenance category allocated the tool or test equipment.

c. Nomenclature. This column lists the noun name and nomenclature of the tools and test equipment required to perform the maintenance functions.

d. National/NATO Stock Number. This column lists the National, NATO stock number of the specified tool or test equipment.

e. Tool Number. This column lists the manufacturer's part number of the tool followed by the Federal Supply Code for manufacturers (5-digit) in parentheses.

D-5. Remarks (sect II)

a. Reference Code. This code refers to the appropriate item in section II, column 6.

b. Remarks. This column provides the required explanatory information necessary to clarify items appearing in section II.

SECTION II MAINTENANCE ALLOCATION CHART
FOR
SIGNATURE ANALYZER TS-3791/U (HP 500A)

SECTION III. TOOL AND TEST EQUIPMENT REQUIREMENTS FOR SIGNATURE ANALYZER TS-3791/U (HP5004A)

TOOL OR TEST EQUIPMENT REF CODE	MAINTENANCE CATEGORY	NOMENCLATURE	NATIONAL/NATO STOCK NUMBER	TOOL NUMBER
1	H	Pulse Generator (TEK PG502)	6625-00-531-5135	
2	H	Pulse Generator SG-1105/U (!HP-8013B)	6625-01-010-3524	
3	H	Oscilloscope OS-262P/U (TEKY 7623A)	6625-01-007-9416	
4	H	Digital Voltmeter ANT/US-451	6625-01-060-6804	
5	0	Common tools necessary to the performance of this maintenance function are available to maintenance personnel for the maintenance category listed.		

APPENDIX E
MANUAL CHANGES

MANUAL DESCRIPTION
INSTRUMENT: 5004A Signature Analyzer
Operating and Service Manual
SERIAL PREFIX:1704A

DATE PRINTED:MARCH 1977
HP PART NO:05004-90001
MICROFICHE NO:05004-90002

CHANGE DATE April 21, 1978
(This change supersedes all earlier dated changes)

- Make all changes listed as ERRATA.
- Check the following table for your instrument's serial prefix or serial number and make listed change(s) to manual.

IF YOUR INSTRUMENT HAS SERIAL PREFIX OR SERIAL NUMBER	MAKE THE FOLLOWING CHANGES TO YOUR MANUAL	IF YOUR INSTRUMENT HAS SERIAL PREFIX OR SERIAL NUMBER	MAKE THE FOLLOWING CHANGES TO YOUR MANUAL
1736A	1		
1808A	1, 2		
▸ 11816A	1, 2, 3		

NEW OR REVISED ITEM

The following Service Notes are available from your local HP Sales and Service Office

MODEL	DESCRIPTION
5004A-1A	Data Probe Threshold Voltage Adjustment and Compensation
▸ 5004A-2	Signature Analyzer Operational Verification (All Prefixes)

ERRATA

Page 6-7, Table 6-1, Replaceable Parts:
Change A2TP1 from 1251-4714 to 05004-20206; 1; TEST POINT; 28480; 05004-20206.
Change A2W1, W2, and W3 from 1251-4750 to 1251-4965 in the HP and Mfr Part Number columns.
Change MP8 reference designation to MP9 and MP9 to MP8 so MP9 identifies the bottom half of the body and MP8 the top half.
Change MP9 from 00545-20203 to 00547-20201 in HP and Mfr Part Number columns.
Add MP15; 1600-0506; RING, GROUNDING; 28480; 1600-0506; as part of probe assembly A3.
This ring mounts on the rear end of the probe body and connects the body to circuit board common.
Change A3A1C3 from 0150-0088 (3.9 PF) to A3A1C3*; 0160-2249; CAPACITOR-FXD 4.7 PF ± .25 PF 500 VDC; 28480; 0160-2249. "FACTORY SELECTED VALUE BETWEEN 4.6 AND 4.9 PF.

Page 8-11, Figure 8-1, Troubleshooting Flowchart:
Change step 1 of "PRELIMINARY STEPS" to the following:
"1. SET FRONT-PANEL SWITCHES AS FOLLOWS: SELF-TEST-IN; START, STOP, CLOCK, AND HOLD-OUT."
Change Table 8-1 NORMAL signature for "Test Point 4" to A446.
Change Table 8-1 SERVICE signature for "Test Point 7" to 6P6F.
Change flow chart in three places to agree with the partial diagram shown in Figure 1.
Inside Title Page:
Change sentence under SERIAL NUMBERS to read "This manual applies directly to instruments with a Serial Number Prefix of 1704A."

Page 1-3, Table 1-2, Recommended Test Equipment:
Add Signature Analyzer, HP Model 5004A with Critical Specs of 15 nanosecond data setup time, START-STOP gating with setup time of 25 microseconds, and TTL compatibility.

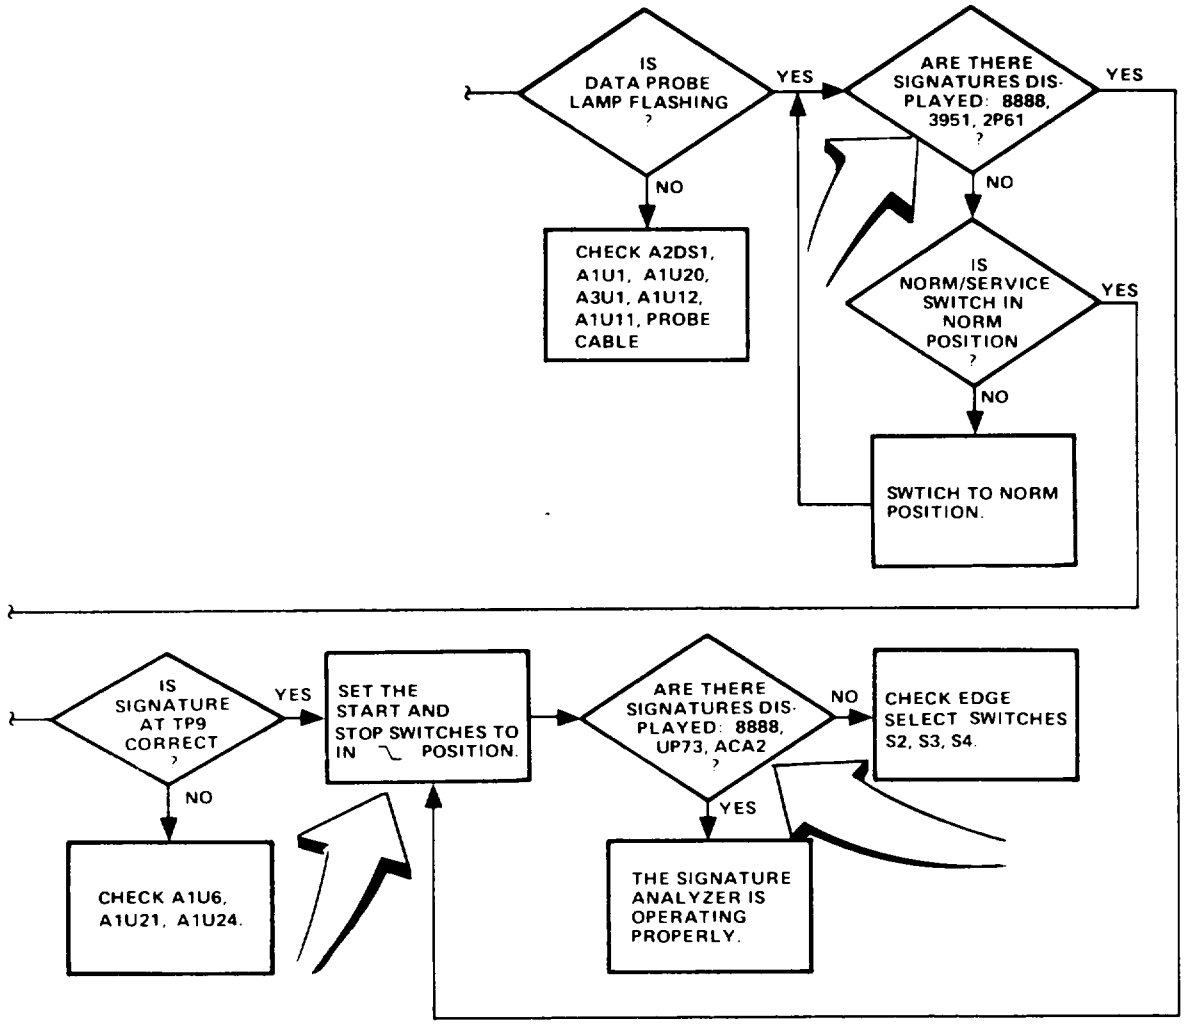

FIGURE 1. FLOWCHART CORRECTIONS

ERRATA (Cont'd)

Page 3-1 Paragraph 3-6. Character Illustration:

Delete the □ character between 9 and B .

Page 6-1 Paragraph 6-2

Change "Table 2"., at end of sentence, to '**Table 6-2** .

Page 8-3, Examples 1 through 4:

Change examples to read as follows:

EXAMPLE 1 says that Z is not true if A is true and B is true or that Z is true if A and B are not both true. $\overline{Z}$ = AB or Z = $\overline{AB}$. This is frequently referred to as NAND (for NOT AND).

EXAMPLE 2 says that Z is true if A is not true or if B is not true Z = $\overline{A} + \overline{B}$. Note that this truth table is identical to that of Example 1. The logic equation is merely .... etc.

EXAMPLE 3 $\overline{Z}$ = A + B or Z = $\overline{A + B}$ and,

EXAMPLE 4 Z = $\overline{A} \bullet \overline{B}$, also share a common truth table and are equivalent transformations of .... etc.

ERRATA (Cont'd)

Page 8-3, Paragraph 8-21:
Change third word to "symbols" in place of "symbols".
Change positive logic symbol for DEVICE 2 to 
Page 8-4, Negative Logic Symbol, Device 1:
Change negative logic symbol to 

Page 8-4, Mixed Logic, NOR Gates for Examples 6 and 7:
Change notation inside both NOR symbols to "> 1" in place of "<1".

Page 8-9, Paragraph 8-36, Second Sentence:
Change NORMAL SERVICE to NORMAL/SERVICE.

Page 8-21, Paragraph 8-95:
Change 8-95 paragraph number under Display Scan to 8-97.
Add the following between paragraphs 8-94 and 8-97:
"8-95. The U28 oscillator output is applied to counter U26, and the output of U26 is applied to display scan decoder U18A. Output from U18A controls register drivers U15, U16, U13, and U14 plus the four transistor switches in U31. Outputs from U15, U16, U13, U14, and U31 control seven-segment displays DS1 through DS4.
8-96. Self Test"

Page 8-27, Figure 8-9, Schematic Diagram:
Change connection for BLK/RED wire to power transformer primary winding. Disconnect wire from present connection on S8. Reconnect to center contact of same section in S8 along with the wire from the upper contact of LINE switch S1.

Page 6-5, Table 6-1, A1 (05004-60007) Replaceable Parts:
Add A1JI; 1251-4743; RECEPTACLE, AC POWER; 28480; 12514743.
Change A1J1 to A1J2; 1251-4778; CONNECTOR 10-PIN PUSH-ON.
Change A1J2 to A1J3; 1251-4777; CONNECTOR 9-PIN PUSH-ON.

Page 6-6, Table 6-1, A1 MISCELLANEOUS Parts:
Delete entire listing for HP Part No. 5040-8013 power receptacle.

Page 8-25, Figure 8-8, A1 Component Locations:
Add "Jl" beside power receptacle in upper right corner.
Change J1 (bottom right corner) to J2 and J2 to J3.

Page 8-27, Figure 8-9, Overall Schematic Diagram:
Change connector on A1 for A3 Data Probe connections from J1 to J2.
Change connector on A1 for A4 Gating Signal Pod from J2 to J3.
Change pin 10 on A1J3 (-11V) to pin 9.
Change pin 11 on A1J3 (common) to pin 7.
Change pin 2 on A1J3 (+5V) to pin 8.
Change pin 11 (common) on A4 pod board to pin 7.

Page 6-7, Table 6-1, Replaceable Parts:
Add "MP16" in Reference Designation column for HP Part No. 5040-0563.
NOTE - This "clip" holds the pod cables in place on the front of the pod.

ERRATA (Cont'd)

- Page 8-27, Figure 8-9, A1 Schematic Diagram:
  Change HP Part Number at top of A1 MAIN (MOTHER) BOARD from 05004-60001 to 05004-60007.
  Change A1R38 from 1500 to 1800 ohms.
  Change reference designator of resistor connected to the base of A8Q6 from "R36" to R40.
- Page 6-6, Table 6-1, A1 (05004-60007) Replaceable Parts:
  Change A1U28 from 1826-0180 (NE555V) to 1826-0355; IC TIMER; 28480; 1826-0355.
  The 1826-0355 timer should be used for replacement in all instruments.
- Page 6-5, Table 6-1, A1 Replaceable Parts:
  Delete A1Q1, A1Q2, A1Q3, and A1Q4.
- Page 6-6, Table 6-1, A1 Replaceable Parts:
  Add A1U31; 1858-0014; 1; TRANSISTOR-ARRAY PNP; 28480; 1858-0014.
- Page 8-13, Figure 8-2, Table 8-2 SERVICE SIGNATURES:
  Delete "2946" signatures for U25 pin 4.
  Change both signatures for U10 pin 12 to "T36F".
  Delete "472A" signatures for U18 pin 13.
  Change N signature for U19 pin 5 to "068C".
  Add "2946" signature for N at U25 pin 9.

CHANGE 1 (1736A)

Page 6-7, Table 6-1, A3 (05004-60005) Probe Assembly:
Add SERIES 1736 to Description of A3 (05004-60005) PROBE ASSEMBLY.
Change MP9 PROB BODY BOTTOM HALF from 00547-20201 to 05004-20207 in "HP Part Number" and "Mfr Part Number" columns of Table 6-1.
Change MP8 PROBE BODY TOP HALF from 05004-20204 to 05004-20208 in "HP Part Number" and "Mfr Part Number" columns of Table 6-1.
Change SWITCH, PUSHBUTTON from 05004-20205 to 00546-40004 in HP and Mfr Part Number columns in Table 6-1.
Add SERIES 1736 to Description of A3A1 (05004-60003).
Change A3A1S1 from 00546-00001 to 00546-00002 in HP and Mfr Part Number columns.
Add to "A3A1 MISCELLANEOUS" HP Part No. 00546-40003; RETAINER, SWITCH A3A1S1; 28480; 00546-40003.
Add to "A3A1 MISCELLANEOUS" HP Part No. 0624-0340; SCREW, SELF TAPPING 0-80 x .188" (for A3A1S1 mounting); 28480; 0624-0340.
Change A3A1C3 from 0160-2249 (4.7 pF Factory Selected Value) to 0121-0505; CAPACITOR-VAR 2.5-10 pF CER (SQUARE ADJ. HOLE); 28480; 0160-2249.
Change A3A1R1 from 0698-7225 (348,) to 0698-7222; RESISTOR-FXD 261Ω 1% .05W F TC=0+-100; 28480; 0698-7222.
Change A3A1R2 from 0698-8875 (27.4D) to 0698-7195; RESISTOR-FXD 19.6Ω 1% .05W F TC=0+-100; 28480; 0698-7195.
Change A3A1R3 from 0698-8874 (127,) to 0698-7214, RESISTOR-FXD 121Ω 1% .05W F TC=0+-100; 28480; 0698-7214.

CHANGE 1 (1736A) (Cont'd)

Page 6-7, Table 6-1, A3 (05004-60005) Probe Assembly:

Change A3A1R4 from 2100-1986 (1000Ω VAR) to 2100-1788; RESISTOR-VAR 500,0 10% C TOP-ADJ 1-TURN; 28480; 2100-1788.

Change A3A1R6 from 0757-0849 (36.5KS,) to 0699-0105; RESISTOR-FXD 36.5KΩ 1% .5W C; 28480; 0699-0105.

Add A3A1R7; 2100-1984; RESISTOR-VAR 100Ω 10% C TOP-ADJ 1-TURN; 28480; 2100-1984.

Add A3A1 R8; 0698-7228; RESISTOR-FXD 464Ω 1% .05W F TC=0+-100; 28480; 0698-7228.

Change A3A1Ul from 1820-0919 to 05004-80001; IC COMPTR ECL A/D DUAL (SELECTED); 28480; 05004-80001.

Add to "A3A1 MISCELLANEOUS" HP Part No. 8710-1177; TOOL, ADJUSTMENT SQUARE SHANK (for A3A1C3); 28480; 8710-1177.

Page 8-24, Figure 8-7, Probe A3 Component Locator:

Replace A3 component locator with attached Figure 2 component locator for the SERIES 1736 Probe.

Page 8-27, Figure 8-9, Schematic Diagram:

Replace A3 (05004-60003 SERIES 1704) schematic diagram of probe with attached Figure 2 diagram for SERIES 1736.

ADJUSTMENT PROCEDURE (FOR A3 SERIES 1736 PROBE)

The series 1736 probe has three adjustments which are factory set and will need adjustment only after repair of the circuit board. Adjustment must be made with the probe covers in place. The covers have access holes under the probe labels. Special adjustment tool 8710-1177 is required for setting variable capacitor C3.

- If probe adjustment is necessary, contact your local HP Sales/Service Office or field engineer for a copy of Service Note 5004A-1A for the recommended adjustment procedure.

Page 6-8, Table 6-1, A4 (05004-60006) Replaceable Parts:

Change A4A1U2 and U3 from 1820-0919 to 05004-80002; IC COMPTR ECL A/D DUAL (SELECTED MC1650L); 28480; 05004-80002.

CHANGE 2 (1808A)

Page 6-5, Table 6-1, A1 (05004-60007) Replaceable Parts:

Add "SERIES 1808" to A1 Description.

Change A1CR4 and CR5 from 1901-0782 (IN5821) to 1901-0673; DIODE-PWR RECT 5US 100V 5A; 03508; A15A.

Page 8-27, Figure 8-9, A1 (05004-60007) Schematic Diagram:

Change A1 series number (top of diagram) from 1704 to 1808.

- **CHANGE 3 (1816A)**

- Pages 6-5 and 6-6, Table 6-1, A1 (05004-60001) Replaceable Parts:

Change A1 series number from 1808 to 1816.

Change A1R37 from 0683-2225 (2200Ω) to 0683-2215, 220 ohms 5% 1/4W; Mfr Part No. CB2215.

Change A1R38 from 0683-1825 (1800Ω) to 0683-1815; 180 ohms 5% 1/4W; Mfr Part No. CB1815.

- Page 8-27, Figure 8-9, A1 (05004-60007) Schematic Diagram:

Change A1 series number (top of schematic) from 1808 to 1816.

Change A1R37 from 2200 to 220 ohms.

Change A1R38 from 1800 to 180 ohms.

- **NOTE: Serial Prefix 1808A instruments with serial numbers of 00602, 00615, 00617, 00618, 00619, 00622, 00625, 00641, 00660, 00662, 00666, and 00674 have the above change for A1R37 and A1R38. The series number on the A1 circuit boards in these instruments is 1808.**
