5DX Structural Process Test Systems**Series II User Interface "error" message recovery process****Situation:**

During install and diagnostic functions, error messages are generated disabling the SVRMGR program. To recover requires running startup. This in itself often creates error messages.

Solution:

Prerequisites: System controller is not locked up. Operator has keyboard and mouse functions. 5DX user interface window is displayed. Under the "SYSTEM" Menu select "Quit 5DX". From the DOS prompt type "dcxobj -uiready" enter. This command will reset the SVRMGR program and initialize all the servers. Using this recovery process allows the operator to run the individual functions with out running the "STARTUP" program in the User Interface Menu. This can save time and minimize error messages during System Setup or troubleshooting. NOTE: The dcxobj program has several parameters attached which might prove to be useful. To list the parameters type "dcxobj -?".
