Situation:

Cable that connects GPIB board and transformer, having a date code of 4/XX/2000 or any date in April of 2000, are assumed to be defective. Possible signs of failure include: unit shut down, front panel display flicker, or bus interface hang-ups. A bus interface hang-up may be indicated by a computer timeout error when the unit is in a test rack.

Solution / Action:

For units returned for any reason in the specified serial number range, replace the defective cable with a good one.
