Situation:

If the display module is pressed into the snap-in mount just by pushing on its top, the glass of the display can break.

This also may happen if too much force is used to remove a display from the snap-in mount.

Solution/Action:

To avoid unnecessary glass breaks do the following steps when you replace the display module:

Removing the display module:

After you have taken off the front panel, carefully press aside the two plastic clips that hold the display in its mount (see picture). Then, with the clips still pressed aside, turn over the front panel and carefully allow the display module fall out of the front panel.

Inserting the display module:

After you inserted the display into the upper plastic holders DO NOT press on the display module! Carefully press aside the two plastic clips (see picture) and allow the display module fall into the mount.

Carefully press aside these plastic clips
while installing or removing the display!
