ADDITIONAL INFORMATION: It is recommended to upgrade the T1250A firmware to a version that includes the fix which is explained hereby.

© AGILENT TECHNOLOGIES, INC. 2013 PRINTED IN U.S.A.

October 28, 2013 Rev. 21

Situation:

It was found that the board T1250-61052 has an amplifier (internal code: U2-AMMP-5024) which is setup to work on an out of specification control voltage (0V), which drained an excessive intensity through the corresponding control pin. This could potentially damage this component prematurely.

Solution/Action:

Therefore, a fix was implemented in the firmware in order to ensure that this control voltage is always above 0.8V. With this software change, reliability of the product is improved.

Required actions:

1. Firmware check. Firmware version can be easily checked with the front panel display and associated keys.

Follow this steps to retrieve current firmware version:

• Press OK at initial screen, to enter SYS menu:

• Press OK again, to enter INFO menu:
